Version 05

December, 2008

1. General Description

This document describes Himax's HX8352-A is supports four types resolution driving controller. The HX8352-A is designed to provide a single-chip solution that combines a gate driver, a source driver, power supply circuit for 262,144 colors to drive a TFT panel with 240RGBx480 dots at maximum.

The HX8352-A can be operated in low-voltage (1.65V) condition for the interface and integrated internal boosters that produce the liquid crystal voltage, breeder resistance and the voltage follower circuit for liquid crystal driver. In addition, the HX8352-A also supports various functions to reduce the power consumption of a LCD system via software control.

The HX8352-A is suitable for any small portable battery-driven and long-term driving products, such as small PDAs, digital cellular phones and bi-directional pagers.

The HX8352-A supports three interface modes, includ Command-Parameter interface mode, Register-Content interface mode. The interface mode is selected by the external pins IFSEL0, P68, BS2~0 setting.

2. Features

2.1 Display

- Resolution
 - 240(H) x RGB(H) x 480(V)
 - 240(H) x RGB(H) x 432(V)
 - 240(H) x RGB(H) x 400(V)
 - 240(H) x RGB(H) x 320(V)
- Display Color modes
 - Normal Display Mode On
 - 65,536(R(5),G(6),B(5)) colors
 - 262,144(R(6),G(6),B(6)) colors
 - Idle Mode On
 - 8 (R(1), G(1), B(1)) colors.

2.2 Display module

- On module VCOM control (-2.0 to 5.5V Common electrode output voltage range)
- On module DC/DC converter
 - VLCD = 4.6 to 6.0V (Source output voltage range)
 - VGH = +9.0 to +16.5V (Positive Gate output voltage range)
 - VGL = -6.0 to -13.5V (Negative Gate output voltage range)
- Frame Memory area 240 (H) x 480 (V) x 18 bit

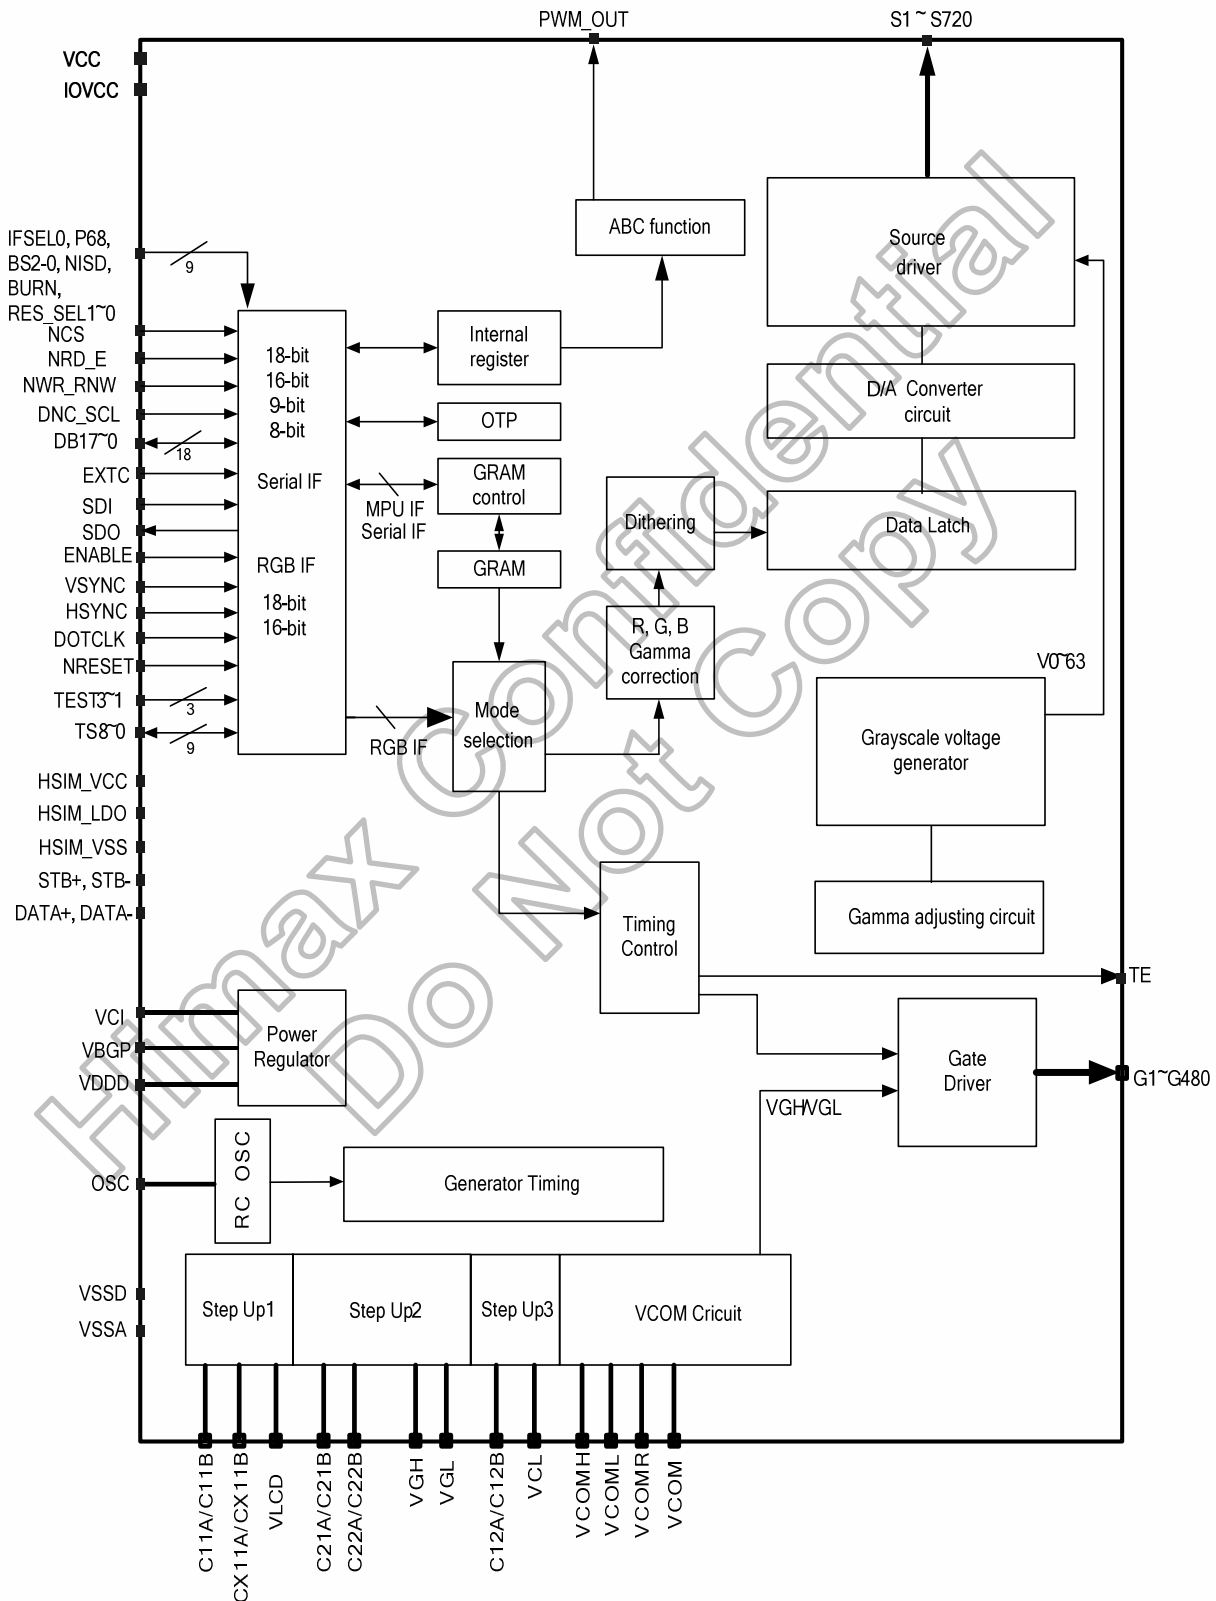

2.3 Display/control interface

- Display Interface types supported
 - 8-/16-/18-bit MPU parallel interface.
 - Serial data transfer interface.
 - 16-/18-data lines parallel video (RGB) interface.
- Control Interface types supported
 - Register-Content interface mode.
- Logic voltage (IOVCC): 1.65 ~ 3.3V
- Logic voltage (VCC): 2.3 ~ 3.3V
- Driver power supply (VCI): 2.3 ~ 3.3V
- Color modes
 - 16 bit/pixel: R(5), G(6), B(5)
 - 18 bit/pixel: R(6), G(6), B(6)

2.4 Miscellaneous

- Low power consumption, suitable for battery operated systems
- Image sticking eliminated function
- CMOS compatible inputs
- Optimized layout for COG assembly
- Temperature range: -40 ~ +85 °C
- Proprietary multi phase driving for lower power consumption
- Support external VDD for lower power consumption (such as 1.8 volts input)
- Support RGB through mode with lower power consumption
- Support Gamma correction of RGB independence
- Support normal black/normal white LCD
- Support wide view angle display
- Support burn-in mode for efficient test in module production
- On-chip OTP (one-time-programming) non-volatile memory

				1	1	0	0	8-bit bus interface, 68-system, 65K-color	D17-D8:Unused D7-D0: Data
				X	1	1	ID	Serial bus IF + RGB interface	DNC_SCL, SDO,SDI, VSYNC, HSYNC, ENABLE, DOTCLK, DB17-0
IFSEL0	I	1	MPU	Interface format select pin					
				IFSEL0	Interface Format Selection				
				0	Command-Parameter interface mode				
				1	Register-content interface mode				
In this case, the IFSEL0 has to be connected to IOVCC.									
EXTC	I	1	MPU	When operate in Register-content interface mode, the EXTC has to be connected to IOVCC or VSSD.					
RES_SEL1~0	I	2	MPU	Panel Resolution select pin.					
				RES_SEL1	RES_SEL0	Panel Resolution	Connection of Gate		
				0	0	240RGB x 320 dot	G1 ~ G320		
				0	1	240RGB x 400 dot	G1 ~ G400		
				1	0	240RGB x 432 dot	G1 ~ G432		
1	1	240RGB x 480 dot	G1 ~ G480						
NCS	I	1	MPU	Chip select signal. Low: chip can be accessed; High: chip cannot be accessed. Must be connected to VSSD if not in use.					
NWR_RNW	I	1	MPU	I80 system: Serves as a write signal and writes data at the rising edge. M68 system: 0: Write, 1: Read. Fix it to IOVCC or VSSD level when using serial bus interface.					
NRD_E	I	1	MPU	I80 system: Serves as a read signal and read data at the low level. M68 system: 0: Read/Write disable, 1: Read/Write enable. Fix it to IOVCC or VSSD level when using serial bus interface.					
DNC_SCL	I	1	MPU	The signal for command or parameter select under parallel mode(i.e. Not serial interface): Low: command, High: parameter. When under serial interface, it servers as SCL.					
BURN	I	1	MPU	Free Running mode If BURN=Hi, this can enable free running mode for burn in test. The display data alternates between full black and full white independent of input data in free running mode.					
SDI	I	1	MPU	Serial data input. If not used, please let it connected to IOVCC or VSSD					

Input Parts				
Signals	I/O	Pin Number	Connected with	Description
VSYNC	I	1	MPU	Frame synchronizing signal. Has to be fixed to IOVCC level if is not used.
HSYNC	I	1	MPU	Frame synchronizing signal. Has to be fixed to IOVCC level if is not used.
ENABLE	I	1	MPU	A data ENABLE signal in RGB I/F mode. Has to be fixed to VSSD level if unused (High active, if EPL=0).
DOTCLK	I	1	MPU	Dot clock signal. Has to be fixed to VSSD level if is not used.
NRESET	I	8	MPU or reset circuit	Reset pin. Setting either pin low initializes the LSI. Must be reset after power is supplied.
OSC	I	1	Oscillation Resistor	Oscillator input for test purpose. If not used, please let it open or connected to VSSD.
VCOMR	I	2	Resistor or open	A VcomH reference voltage. When adjusting VcomH externally, set registers to halt the VcomH internal adjusting circuit and place a variable resistor between VREG1 and VSSD. Otherwise, leave this pin open and adjust VcomH by setting the internal register of the HX8352-A.
VGS	I	2	VSSD or external resistor	Connect to a variable resistor to adjusting internal gamma reference voltage for matching the characteristic of different panel used.

Output Part				
Signals	I/O	Pin Number	Connected with	Description
S1~S720	O	720	LCD	Output voltages applied to the liquid crystal.
G1~G480	O	480	LCD	Gate driver output pins. These pins output VGH, VGL.(If not used, should be open)
VCOM	O	7	TFT common electrode	The power supply of common voltage in TFT driving. The voltage amplitude between VCOMH and VCOML is output. Connect this pin to the common electrode in TFT panel.
TE	O	2	MPU	Tearing effect output. If not used, please open this pin.
SDO	O	2	MPU	Serial data output. If not use, let it to open.
NISD	O	2	Open	Image Sticking Discharge signal. This pin is used for monitoring image sticking discharge phenomena. When the NISD goes low, the VGL, Source and VCOM would be discharged to VSSA. When the NISD goes high, the VGL, Source and VCOM are normal operation.
PWM_OUT	O	2	External LED driver IC	Backlight On/Off control pin. If use ABC function, the pin can connect to external LED driver IC. The output voltage range = 0~ IOVCC.
NWR2	O	2	Sub Panel	80-interface NWR signal output pin for Sub Panel
E2	O	2	Sub Panel	68-interface Enable signal output pin for Sub Panel
NCS2	O	2	Sub Panel	The signal is Chip select for Sub Panel.
RS2	O	2	Sub Panel	The signal is register index or register parameter select for Sub Panel

HSIM Interface Parts				
Signals	I/O	Pin Number	Connected with	Description
STB+, STB-	-	2 2	HSIM Host	High Speed Interface Strobe differential signal input pins. STB+ pin for Strobe+, STB- pin for Strobe-. Connect to a terminal resistance (100Ω) between STB+ and STB-. If not used, please let it connected to VSSD.
DATA+, DATA-	-	2 2	HSIM Host	High Speed Interface Data differential signal input pins. DATA+ pin for Data+, DATA- pin for Data-. Connect to a terminal resistance (100Ω) between DATA+ and DATA-. If not used, please let it connected to VSSD.
HSIM_VCC	P	8	Power Supply	High Speed Interface I/O power supply pin, 2.3V~3.3V.
HSIM_VSS	P	6	Ground	High Speed Interface I/O ground pin.

HSIM_LDO	O	1	Capacitor	High Speed Interface regulator output pin. Connect to a stabilizing capacitor between HSIM_VSS and HSIM_LDO If not used, please open these pins.
----------	---	---	-----------	--

Input/Output Part				
Signals	I/O	Pin Number	Connected with	Description
C11A,C11B CX11A, CX11B	I/O	10,10 10,10	Step-up Capacitor	Connect to the step-up capacitors according to the step-up 1 factor. Leave this pin open if the internal step-up circuit is not used.
C12A, C12B	I/O	8,8	Step-up Capacitor	Connect to the step-up capacitors for step up circuit 2 operation. Leave this pin open if the internal step-up circuit is not used.
C21A,C21B C22A,C22B	I/O	12,12 12,12	Step-up Capacitor	Connect these pins to the capacitors for the step-up circuit 2. According to the step-up rate. When not using the step-up circuit2, disconnect them.
DB17~0/ PD17~0 (DBS17~0)	I/O	36	MPU	When Operates in system interface mode, it is used liked an 18-bit bi-directional data bus. 8-bit bus: use DB7-DB0 16-bit bus: use DB15-DB0 18-bit bus: use DB17-DB0 When Operation in RGB interface mode, it is an 18-bit bus RGB data bus. If not used, please open these pins.
GPIO7~0	I/O	16	-	Standard Input/Output pin As for GPIO7 to 0 terminal, setting of an input and output direction is possible. If not used, please open these pins.

Power Part				
Signals	I/O	Pin Number	Connected with	Description
IOVCC	P	9	Power Supply	Digital IO Pad power supply, 1.65V~3.3V
VCC	P	2	Power Supply	Digital power supply, 2.3V~3.3V
VCI	P	6	Power Supply	Analog power supply, 2.3V~3.3V
VSSD	P	13	Ground	Digital ground
VSSA	P	13	Ground	Analog ground
VDDD	O	16	Stabilizing Capacitor	Output from internal logic voltage (1.6V). Connect to a stabilizing capacitor
REGVDD	I	1	MPU	If REGVDD = high, the internal VDDD regulator will be turned on. If REGVDD = low, the internal VDDD regulator will be turned off, VDDD should connect to external power supply, the voltage range 1.65~1.95V. Must be connected to IOVCC or VSSD.
VBGP	-	2	Open	Band Gap Voltage. Let it to be open.
VREG1	P	4	Stabilizing Capacitor	Internal generated stable power for source driver unit.
VREG3	P	4	Stabilizing Capacitor	A reference voltage for VGH&VGL.
VCOMH	P	4	Stabilizing capacitor	Connect this pin to the capacitor for stabilization. This pin indicates a high level of VCOM amplitude generated in driving the VCOM alternation.
VCOML	P	7	Stabilizing capacitor	When the VCOM alternation is driven, this pin indicates a low level of VCOM amplitude. Connect this pin to a capacitor for stabilization.

Power Part				
Signals	I/O	Pin Number	Connected with	Description
VCL	P	6	Stabilizing capacitor	A negative voltage for VCOML circuit, VCL=-VCI
VLCD	P	6	Stabilizing capacitor	An output from the step-up circuit1. Connect to a stabilizing capacitor between VSSA and VLCD. Place a schottkey barrier diode (see "configuration of the power supply").
VGH	P	6	Stabilizing capacitor	An output from the step-up circuit2.or 4 ~ 6 time the VCI level. The step-up rate is determined with BT3-0 bits. Connect to a stabilizing capacitor between VSSD and VGH. Place a schottkey barrier diode between VCI and VGH. Place a schottkey barrier diode (see "configuration of the power supply").
VGL	P	6	Stabilizing capacitor	An output from the step-up circuit2.or -3~ -5 time the VCI level. The step-up rate is determined with BT3-0 bits. Connect to a stabilizing capacitor between VSSD and VGL. Place a schottkey barrier diode between VSSD and VGL. Place a schottkey barrier diode (see "configuration of the power supply").

Test Pin and Others				
Signals	I/O	Pin Number	Connected with	Description
TEST3-1	I	3	GND	Test pin input (Internal pull low)
TS8~0	O	18	Open	A test pin. Disconnect it.
VTEST	O	1	Open	A test pin. Disconnect it.
DUMMYR1-2	-	2	Open	Dummy pads. Available for measuring the COG contact resistance. DUMMYR1 and DUMMYR2 are short-circuited within the chip.
DUMMYR3-4	-	2	Open	Dummy pads. Available for measuring the COG contact resistance. DUMMYR3 and DUMMYR4 are short-circuited within the chip.
DUMMY	-	99	Open	Dummy pads
IOGNDDUM1-10	O	12	Open	Leave them open.
PADA0,PADB0	I	2	MPU	Test pin for display glass break detection. If not used, please open these pins.
PADA1~ PADA4, PADB1~ PADB4	I	4	MPU	Test pin for chip attachment detection. If not used, please open these pins.
DMY_IOVCC	O	10	-	Dummy IOVCC output pads, Internal connected to IOVCC and only for external Hardware setting pin use. If not used, please open these pins.
DMY_GND	O	8	-	Dummy GND output pads, Internal connected to VSSD and only for external Hardware setting pin use. If not used, please open these pins.
TEST_MODE	-	1	Open	A test pin. Disconnect it.
TEST_PAD_DRV	-	1	Open	A test pin. Disconnect it.
TEST_MODE_CLK	-	1	Open	A test pin. Disconnect it.

4.2 Pin assignment

Chip Size: 18680 um x 1020 um
(Including Seal-ring 20 um *2
Scribe line 40 um *2)

Chip Thickness: 300 um (typ.)

Pad Location: Pad center

Coordinate Origin: Chip center

Au Bump Size:

1. 24 um x 120 um

Input/Output

(No. 1 ~ No. 446)

2. 106 um x 14 um

Staggered LCD output side

(No. 447 ~ No. 477)

3. 14 um x 106 um

Staggered LCD output side

(No. 478 ~ No. 1675)

4. 106 um x 14 um

Staggered LCD output side

(No. 1676 ~ No. 1706)

5. Function Description

5.1 Interface control mode

The HX8352-A supports four-type interface mode: Command-Parameter interface mode, Register-Content interface mode, RGB interface mode. Command-Parameter interface mode, Register-Content interface mode are selected by the external pins IFSEL0, BS2-0 setting as shown in Table5.1. There are two-type chip access formats in HX8352-A. One is register command for chip internal operation. The other is display data for chip display.

IFSEL0	BS2-0	Register Data	Display Data
0	000, 001, 010, 011, 100, 101, 110	Command-Parameter interface (MPU interface)	GRAM
0	111	Command-Parameter interface (SPI + RGB interface)	Normal: RGB interface
1	000, 001, 010, 011, 100	Register-Content interface (MPU interface)	GRAM
1	11x	Register-Content interface (SPI + RGB interface)	Normal: RGB interface

Table 5. 1 Interface Mode Selection

There are two-type register groups in HX8352-A. One is accessed only via Command-Parameter interface. The other is accessed only via Register-Content interface.

This manual description focuses on Register-Content interface mode and RGB interface mode, about the Command-Parameter interface mode; please refer to the HX8352-A(N) datasheet for detail.

5.1.1 Register-content interface mode

The register-content interface circuit in HX8352-A supports 18-/16-/8-bit bus width parallel bus system interface for I80 series and M68 series CPU, and serial bus system interface for serial data input. When NCS = "L", the parallel and serial bus system interface of the HX8352-A become active and data transfer through the interface circuit is available. The DNC_SCL pin specifies whether the system interface circuit access is to the register command or to the GRAM. The input bus width format of system interface circuit is selected by external pins BS(2-0) setting. For selecting the input bus format, please refer to Table5.2 and Table5.3.

In Register-Content interface, it includes an Index Register (IR) be stored index data of internal control register and GRAM. Therefore, the IR can be written with the index pointer of the control register through data bus by setting DNC_SCL=0. Then the command or GRAM data can be written to register at which that index pointer pointed by setting DNC_SCL=1.

Furthermore, there are two 18-bit bus control registers used to temporarily store the data written to or read from the GRAM. When the data is written into the GRAM from the MPU, it is first written into the write-data latch and then automatically written into the GRAM by internal operation. Data is read through the read-data latch when reading from the GRAM. Therefore, the first read data operation is invalid and the following read data operations are valid.

P68	Input signal format selection
0	Format for I80 series MPU
1	Format for M68 series MPU

Table 5. 2 MPU selection in Register-content Interface Circuit

BS2	BS1	BS0	Interface	Transferring Method of RAM data	Transferring Method of Command
0	0	0	16-bit system interface	16-bit collective	8-bit collective
0	0	1		16-bit + 2 bit	
0	1	0	18-bit system interface	18-bit collective	
0	1	1	8-bit system interface	8-bit + 8-bit + 8-bit	
1	0	0		8-bit + 8-bit	
1	1	x	Serial bus transfer interface	16 or 24-bit serial	8-bit serial

Table 5. 3 Interface Selection in Register-content Interface Mode

5.1.2 Parallel bus system interface

The input / output data from data pins (DB17-0) and signal operation of the I80/M68 series parallel bus interface are listed in Table 5.2.

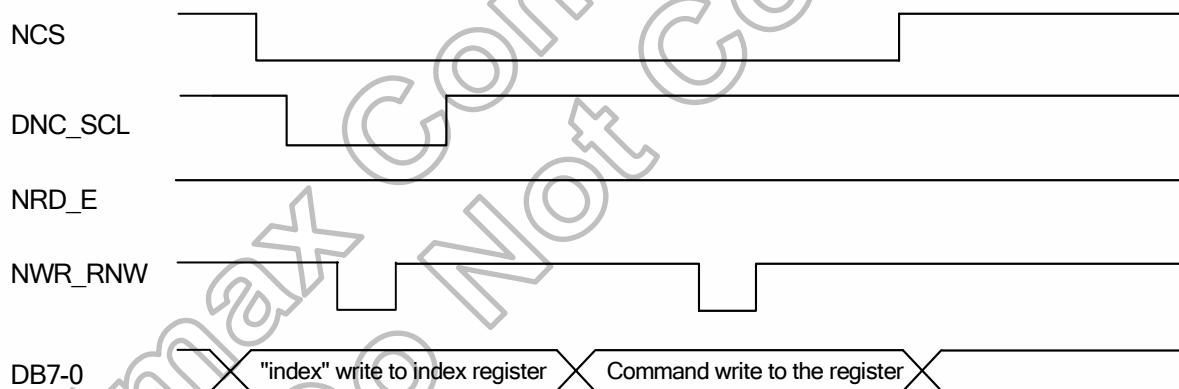

Operations	NRD_E	NWR_RNW	DNC_SCL
Writes Indexes into IR	0	1	0
Reads internal status	1	0	0
Writes command into register or data into GRAM	0	1	1
Reads command from register or data from GRAM	1	0	1

Table 5. 4 Data Pin Function for I80 Series CPU

Operations	NRD_E	NWR_RNW	DNC_SCL
Writes Indexes into IR	1	0	0
Reads internal status	1	1	0
Writes command into register or data into GRAM	1	0	1
Reads command from register or data from GRAM	1	1	1

18-bit Parallel bus system interface

The I80-system 18-bit parallel bus interface in command-parameter interface mode can be used by setting external pins “P68, BS2, BS1, BS0” pins to “0010”. And the M68-system 18-bit parallel bus interface in command-parameter interface mode can be used by setting “P68, BS2, BS1, and BS0” pins to “1010”. Figure 5.7 is the example of interface with I80/M68 microcomputer system interface.

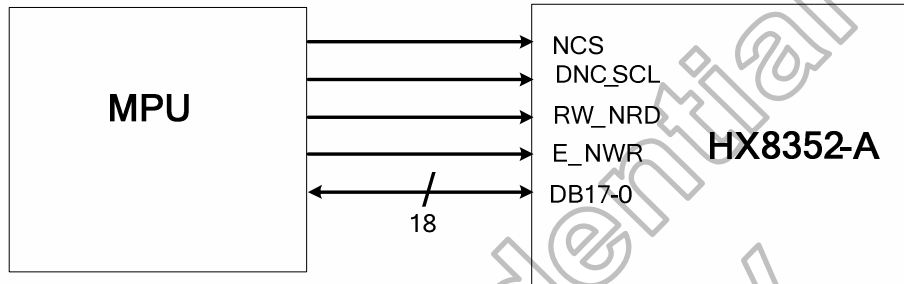

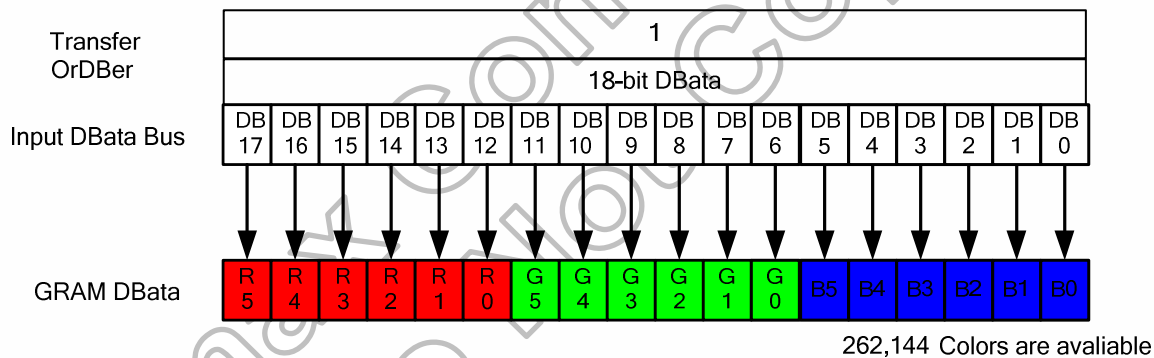

Figure 5. 7 Example of I80- / M68- System 16-Bit Parallel Bus Interface

262,144 Colors are available

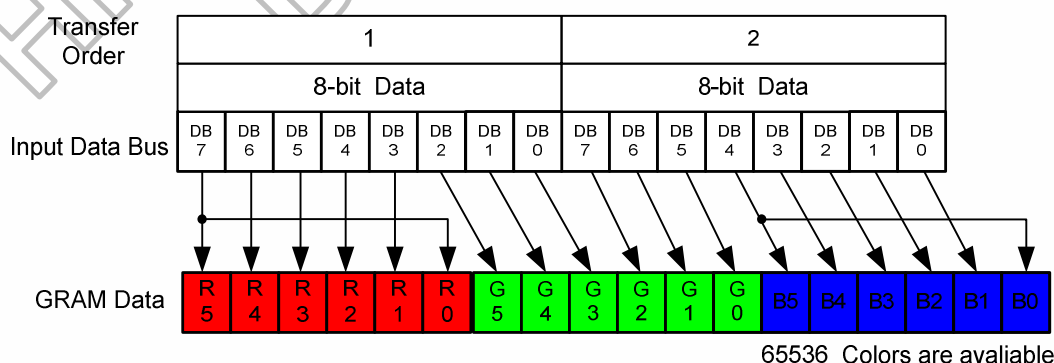

Figure 5.14 Input Data Bus and GRAM Data Mapping in 8-Bit Bus System Interface with 16(5 + 6 + 5) Bit-Data Input (‘BS2, BS1, BS0’=‘100’)

5.1.3 Serial bus system interface

The HX8352-A supports the serial bus interface in register-content mode by setting external pins “BS2, BS1” pins to “11”. The serial bus system interface mode is enabled through the chip select line (NCS), and it is accessed via a control consisting of the serial input data (SDI), serial output data (SDO) and the serial transfer clock signal (DNC_SCL).

As the chip select signal (NCS) goes low, the start byte needs to be transferred first. The start byte is made up of 6-bit bus device identification code, register select (RS) bit and read/write operation (RW) bit. The five upper bits of 6-bit bus device identification code must be set to “01110”, and the least significant bit of the identification code must be set as the external pin BS0 input as “ID”.

The seventh bit (RS) of the start byte determines internal index register or register, GRAM accessing. RS must be set to “0” when writing data to the index register or reading the status and it must be set to “1” when writing or reading a command or GRAM data. The read or write operation is selected by the eighth bit (RW) of the start byte. The data is written to the chip when R/W = 0, and read from chip when RW = 1.

RS	RW	Function
0	0	Writes Indexes into IR
1	0	Writes command into register or data into GRAM
1	1	Reads command from register or data from GRAM

Table 5. 6 The Function of RS and R/W Bit bus

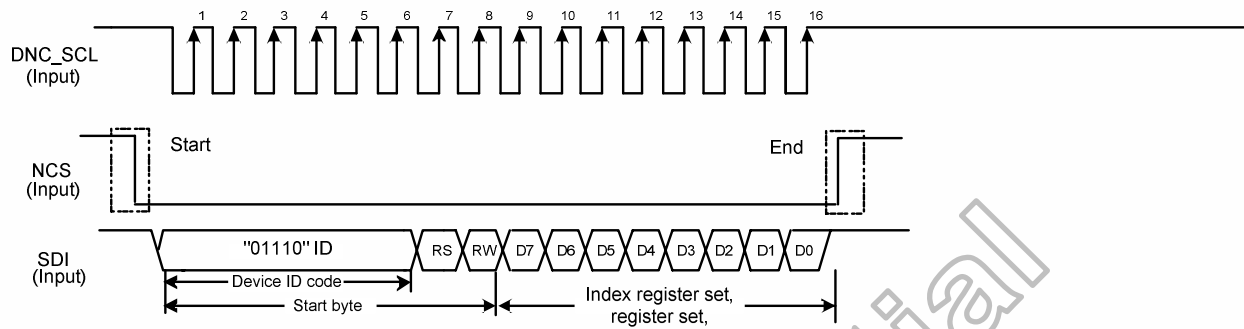

Figure 5. 15 Data Write Timing in Serial Bus System Interface

A) Transfer Timing Format in Serial Bus Interface for Internal Status or Register Read

Figure 5. 16 Data Write Timing in Serial Bus System Interface

5.1.4 RGB interface

The HX8352-A supports the RGB interface for writing animated display data. The RGB interface can be selected by setting external BS2-1 = 11. In RGB interface, the display operations is executed in synchronization with the frame synchronizing signal (VSYNC), line synchronizing signal (HSYNC) and dot clock (DOTCLK), and the display data is inputted via RGB interface circuit without being written to the GRAM and display directly. The display data are transferred in pixel unit via D17-0 input pins. The display data input is latched on the rising edge of DOTCLK (DPL bit = 0) or the falling edge of DOTCLK (DPL bit = 1) by the chip when ENABLE signal is valid. Please refer to Table 5.7.

EPL	ENABLE	Display Data to Panel
0	1	Enable
0	0	Disable
1	1	Disable
1	0	Enable

Table 5. 7 EPL Bit Setting and Valid Enable Signal

Figure 5. 17 RGB Interface Circuit Input Timing

There are two types bit format per pixel color order for writing GRAM data in 18-bit bus interface selected by internal bits CSEL(2-0). The setting is shown in Figure 5. 18 and Figure 5. 19.

(1) 16 bit/pixel color order (R 5-bit, G 6-bit, B 5-bit), 65,536 colors (CSEL(2-0) = "101")

Figure 5. 18 16-Bit / Pixel Data Input of RGB Interface

(2) 18 bit/pixel color order (R 6-bit, G 6-bit, B 6-bit), 262,144 colors (CSEL(2-0) = "110")

Figure 5. 19 18-Bit / Pixel Data Input of RGB Interface

5.2 Address counter (AC)

The HX8352-A contains an address counter (AC) which assigns address for writing/reading pixel data to/from GRAM. The address pointers set the position of GRAM whose addresses range:

RES_SEL1	RES_SEL0	X Range	Y Range	Panel Resolution
0	0	0~239d	0~319d.	240RGB x320 dot
0	1	0~239d	0~399d.	240RGB x400 dot
1	0	0~239d	0~431d.	240RGB x432 dot
1	1	0~239d	0~479d.	240RGB x480 dot

Table 5. 8 Addresses Counter Range

Every time when a pixel data is written into the GRAM, the X address or Y address of AC will be automatically increased by 1 (or decreased by 1), which is decided by the register (MV, MX and MY bit) setting.

To simplify the address control of GRAM access, the window address function allows for writing data only to a window area of GRAM specified by registers. After data is written to the GRAM, the AC will be increased or decreased within setting window address-range which is specified by the Column address register (start: SC, end: EC) or the Row address register (start: SP, end: EP). Therefore, the data can be written consecutively without thinking a data wrap by those bit function.

5.2.1 MCU to memory write/read direction

Figure 5. 20 MCU to Memory Write/Read Direction

The data is written in the order as illustrated above. The counter that dictates which physical memory the data is to be written is controlled by “Memory Access Control” Command, Bits MY, MX, MV as described below.

Figure 5. 21 MY, MX, MV Setting of 240RGB x 432 Dot

MV	MX	MY	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Row Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (431-Physical Row Pointer) with SC
0	1	0	Direct to (239-Physical Column Pointer)	Direct to Physical Row Pointer
0	1	1	Direct to (239-Physical Column Pointer)	Direct to (431-Physical Row Pointer)
1	0	0	Direct to Physical Row Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (431-Physical Row Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Row Pointer	Direct to (239-Physical Column Pointer)
1	1	1	Direct to (431-Physical Row Pointer)	Direct to (239-Physical Column Pointer)

Table 5. 9 MY, MX, MV Setting of 240RGB x 432 Dot

The following figure depicts the update method set by MV, MX and MY bit.

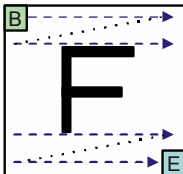

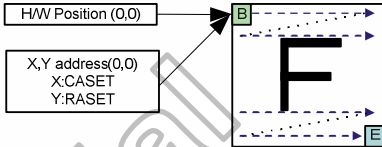

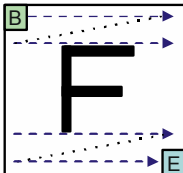

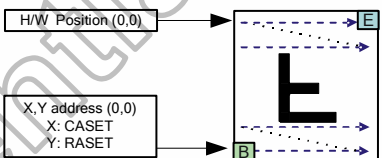

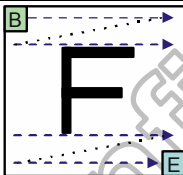

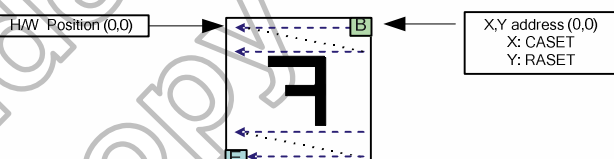

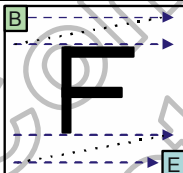

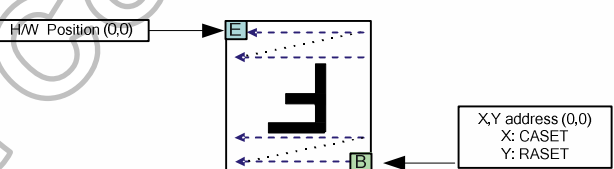

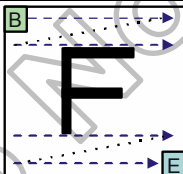

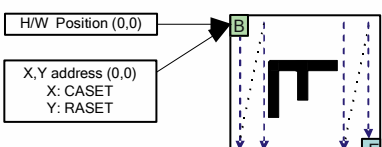

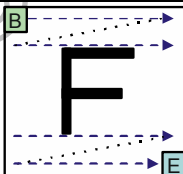

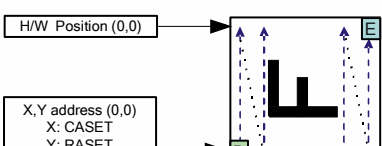

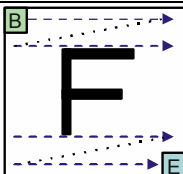

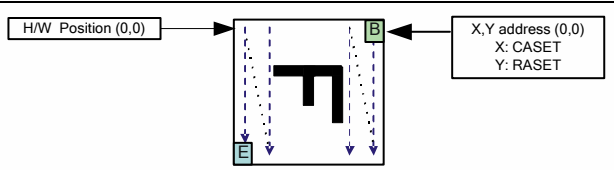

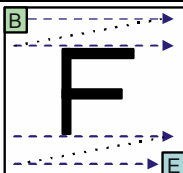

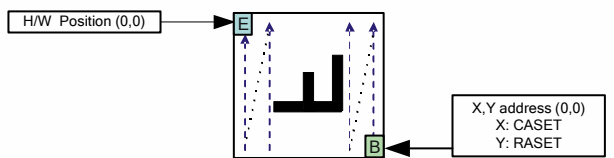

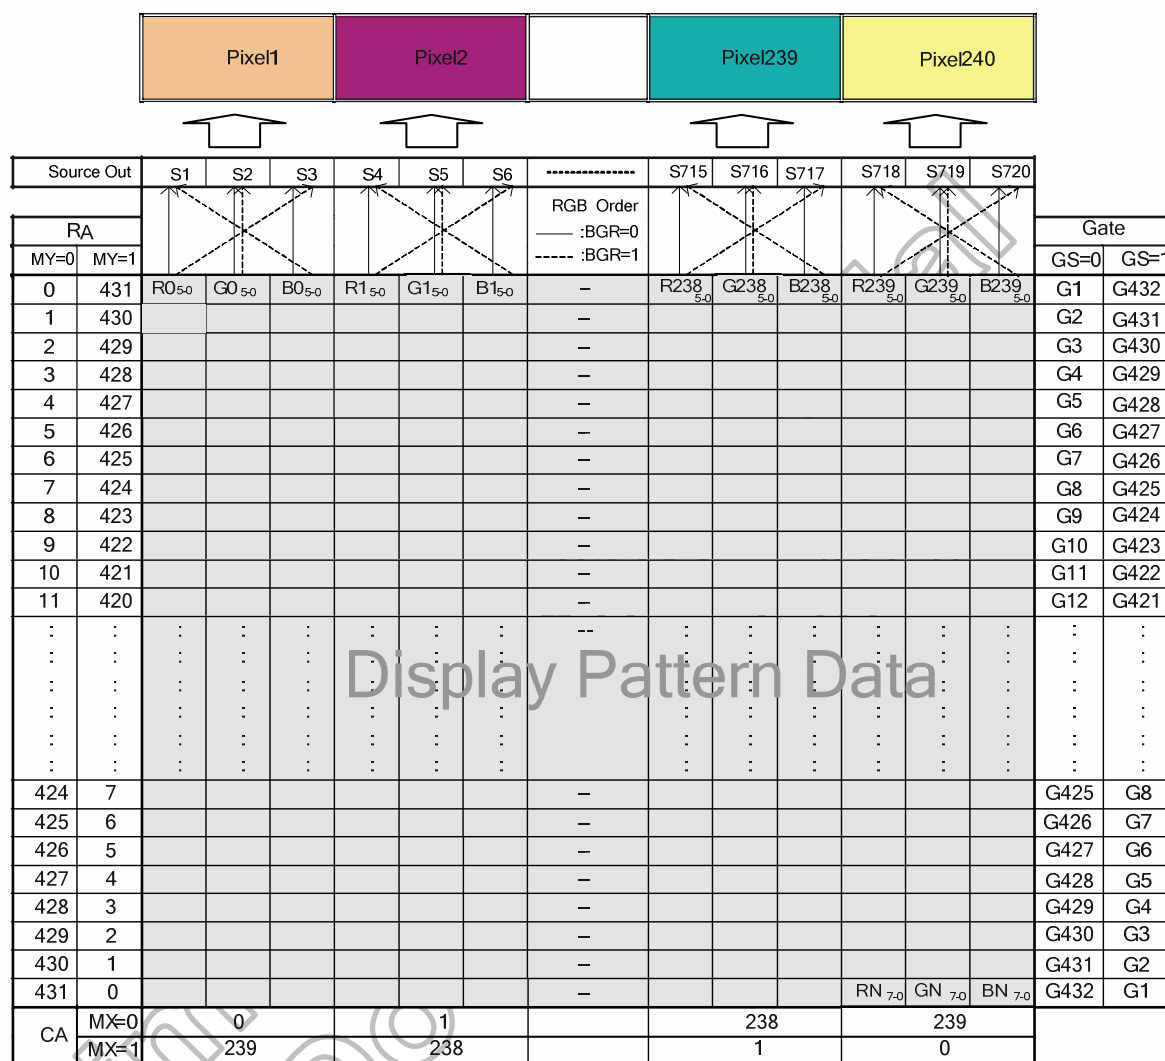

Display Data Direction	Memory Access Control			Image in the Host	Image in the Driver (GRAM)
	MV	MX	MY		
Normal	0	0	0		
Y-Mirror	0	0	1		
X-Mirror	0	1	0		
X-Mirror Y-Mirror	0	1	1		
X-Y Exchange	1	0	0		
X-Y Exchange Y-Mirror	1	0	1		
X-Y Exchange X-Mirror	1	1	0		
X-Y Exchange X-Mirror Y-Mirror	1	1	1

5.3 Source, gate and memory map

Note: **RA** = Row Address,
CA = Column Address,
MX = Mirror X-axis (Column address direction parameter), D6 parameter of Memory Access Control (R16h) command
MY = Mirror Y-axis (Row address direction parameter), D7 parameter of Memory Access Control (R16h) command
GS = Scan direction parameter, D4 parameter of Memory Access Control (R16h) command
BGR = Red, Green and Blue pixel position change, D3 parameter of Memory Access Control (R16h) command

Figure 5. 23 Memory Map (240RGBx432)

5.4 Tearing effect output line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

5.4.1 Tearing effect line modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

Figure 5.24 TE Mode 1 Output

t_{vdh} = The LCD display is not updated from the Frame Memory

t_{vdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see below)

Mode 2, the Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 480 (RES_SEL[1:0]=11) H-sync pulses per field.

Figure 5.25 TE Mode 2 Output

t_{vdh} = The LCD display is not updated from the Frame Memory

t_{vdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see above)

Note: During Sleep in Mode, the Tearing Output Pin is active Low.

Figure 5.26 TE Output Waveform

5.4.2 Tearing effect line timing

The Tearing Effect signal is described below.

Figure 5.27 Tearing Effect Signal Output

Idle Mode Off (Frame Rate = TBD Hz)

Symbol	Parameter	Min.	Max.	Unit	Description
t _{vdl}	Vertical Timing Low Duration	TBD	-	ms	-
t _{vdh}	Vertical Timing High Duration	BP+FP	-	Line	-
t _{hdl}	Horizontal Timing Low Duration	TBD	-	us	-
t _{hdh}	Horizontal Timing High Duration	TBD	500	us	-

Note: (1) The timings in Table 5.13 apply when Memory Access Control GS=0 and GS=1.

(2) BP = Back porch, FP = Font porch.

Table 5.10 AC Characteristics of Tearing Effect Signal

The signal's rise and fall times (t_f , t_r) are stipulated to be equal to or less than 15ns.

Figure 5.28 AC Characteristics of Tearing Effect Signal

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

Example 1: MPU write is faster than panel read

Figure 5. 29

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

Figure 5. 30

Example 2: MPU write is slower than panel read

Figure 5. 31

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer “catches” the MPU to Frame memory write position.

Figure 5. 32

5.5 Oscillator

The HX8352-A can oscillate an internal R-C oscillator with an internal oscillation resistor (Rf). The oscillation frequency is changed according to the RADJ[3:0] internal register. Please refer to OSC control register (R17h). The default frequency is 7.5MHz.

Figure 5. 33 Oscillation Circuit

5.6 Source driver

The HX8352-A contains a 720 channels of source driver (S1~S720) which is used for driving the source line of TFT LCD panel. The source driver converts the digital data from GRAM into the analog voltage for 720 channels and generates corresponding gray scale voltage output, which can realize a 262K colors display simultaneously. Since the output circuit of this source driver incorporates an operational amplifier, a positive and a negative voltage can be alternately outputted from each channel.

5.7 Gate driver

The HX8352-A contains a 480 gate channels of gate driver (G1~G480) which is used for driving the gate. The gate driver level is VGH when scan some line, VGL the other lines.

5.8 LCD power generation circuit

5.8.1 LCD power generation scheme

The boost voltage generated is shown as below.

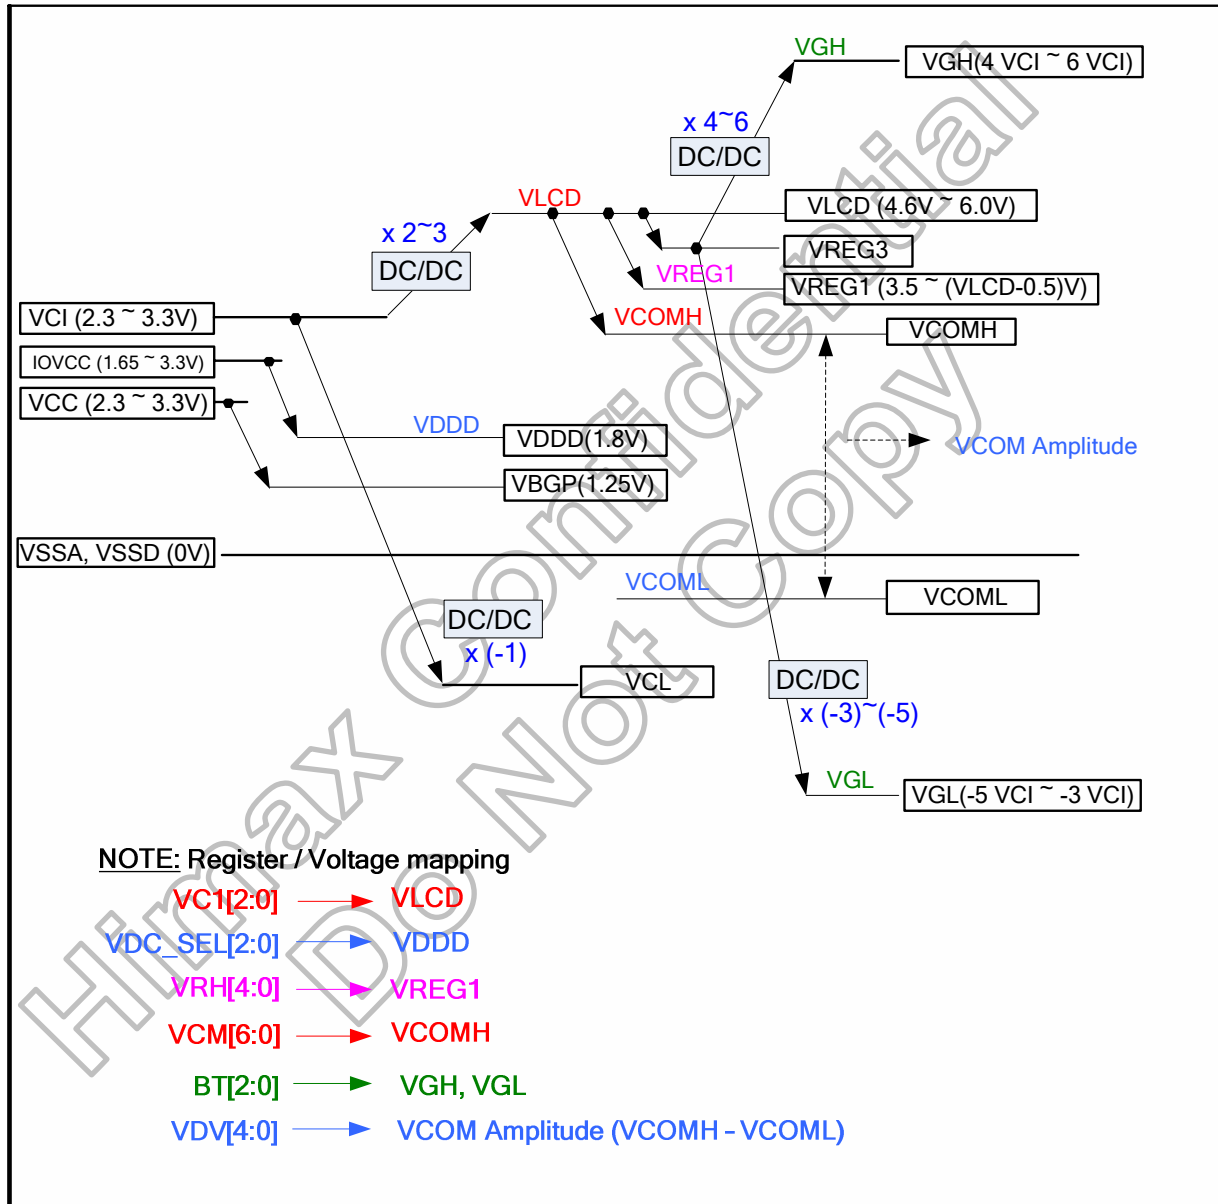

Figure 5. 34 LCD Power Generation Scheme

5.8.2 Various boosting steps

The boost steps of each boosting voltage are selected according to how the external capacitors are connected. Different booster applications are shown as below.

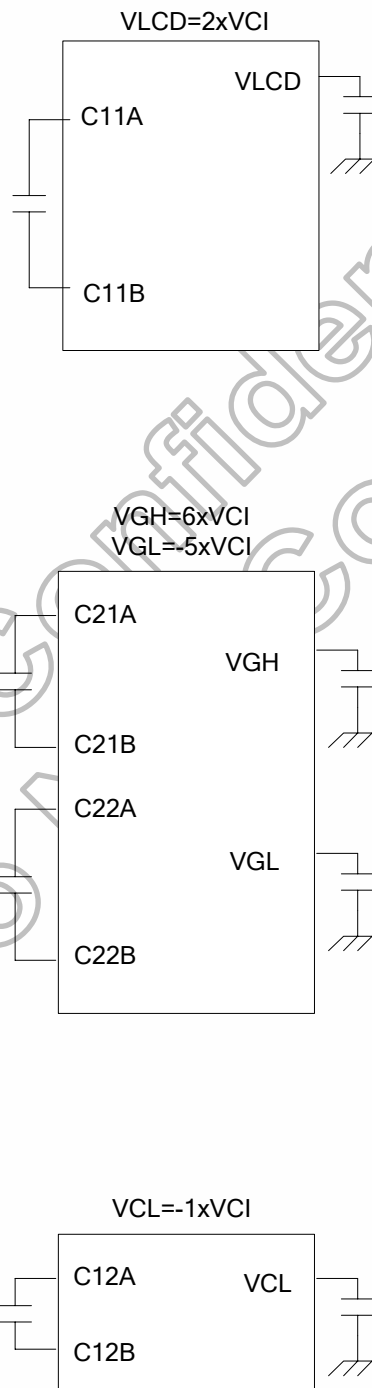

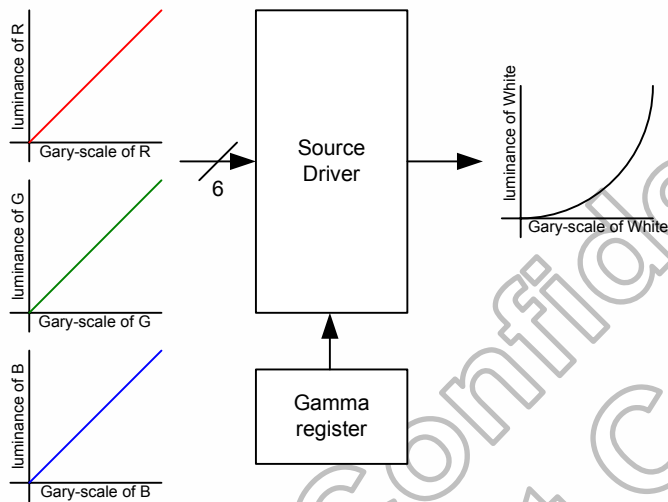

Figure 5. 35 Various Boosting Steps

5.9 Gamma adjustment

The HX8352-A offers two kinds of Gamma adjustment ways to come to accord with LC characteristic, one kind is through Source Driver directly, another one is adjusted by the digital gamma correction. The Gamma adjustment way is select by internal register DGC_EN bit.

A) Gamma adjustment of Source Driver

B) Gamma adjustment of Digital Gamma Correction

Figure 5. 36 Gamma Adjustments Different of Source Driver with Digital Gamma Correction

5.9.1 Gray voltage generator for source driver

The HX8352-A incorporates gamma adjustment function for the 262,144-color display (64 grayscale for each R, G, B color). Gamma adjustment operation is implemented by deciding the 8 grayscale levels firstly in gamma adjustment control registers to match the LCD panel. These registers are available for both polarities.

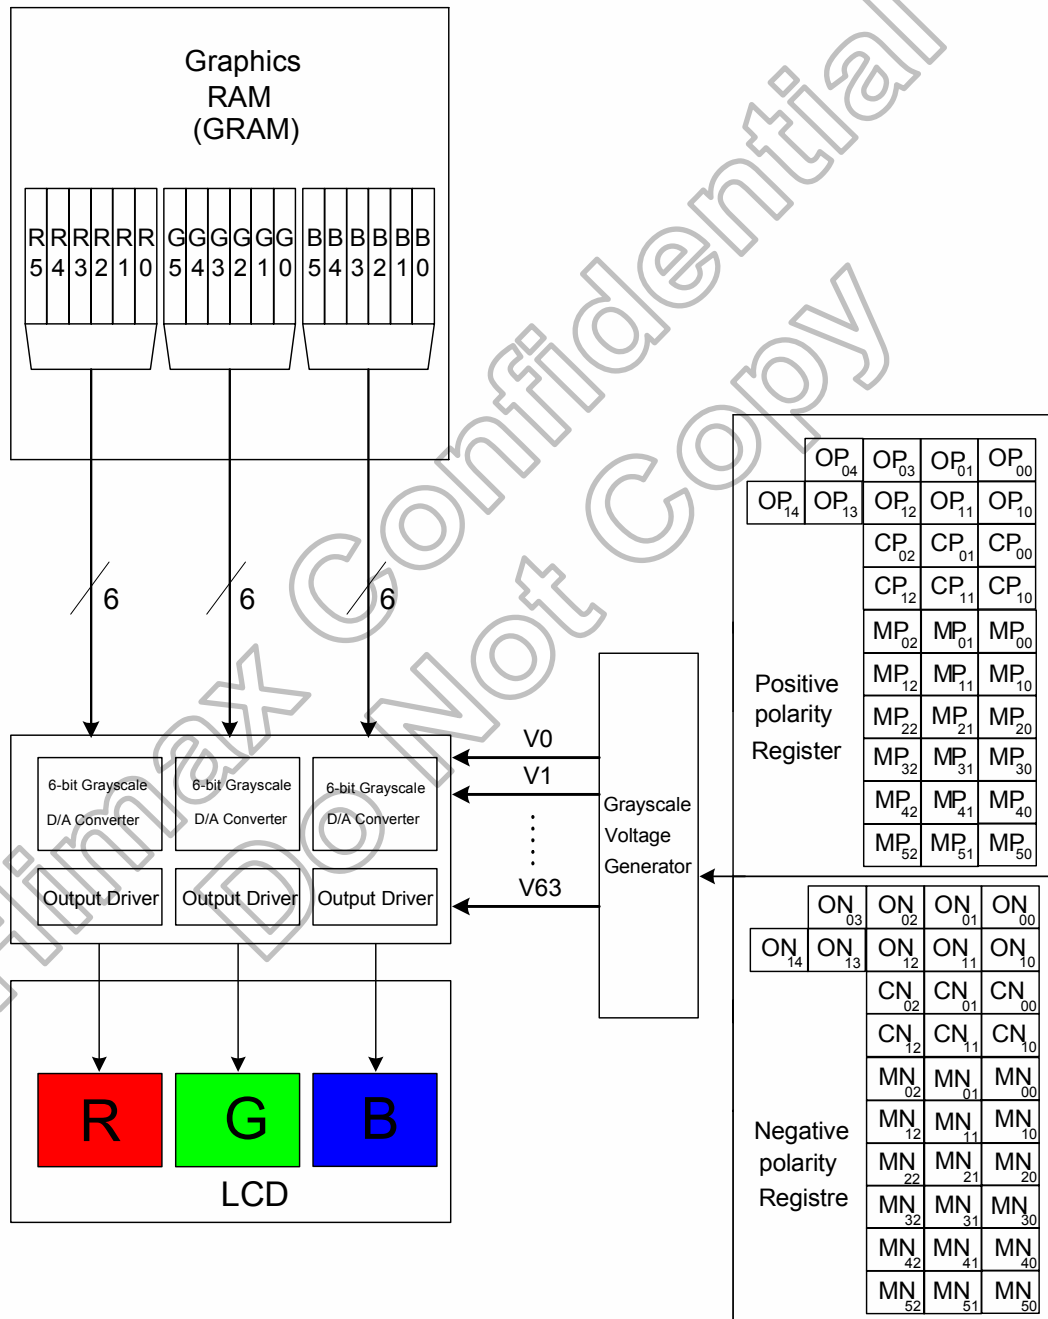

Figure 5. 37 Grayscale Control

5.9.1.1 Structure of grayscale voltage generator

Eight reference gamma voltages $V_{gP/N}(0, 1, 8, 20, 43, 55, 62, 63)$ for positive and negative polarity are specified by the center adjustment, the micro adjustment and the offset adjustment registers firstly. With those eight voltage injected into specified node of grayscale voltage generator, totally 64 grayscale voltages (V_0 - V_{63}) can be generated from grayscale amplifier for LCD panel.

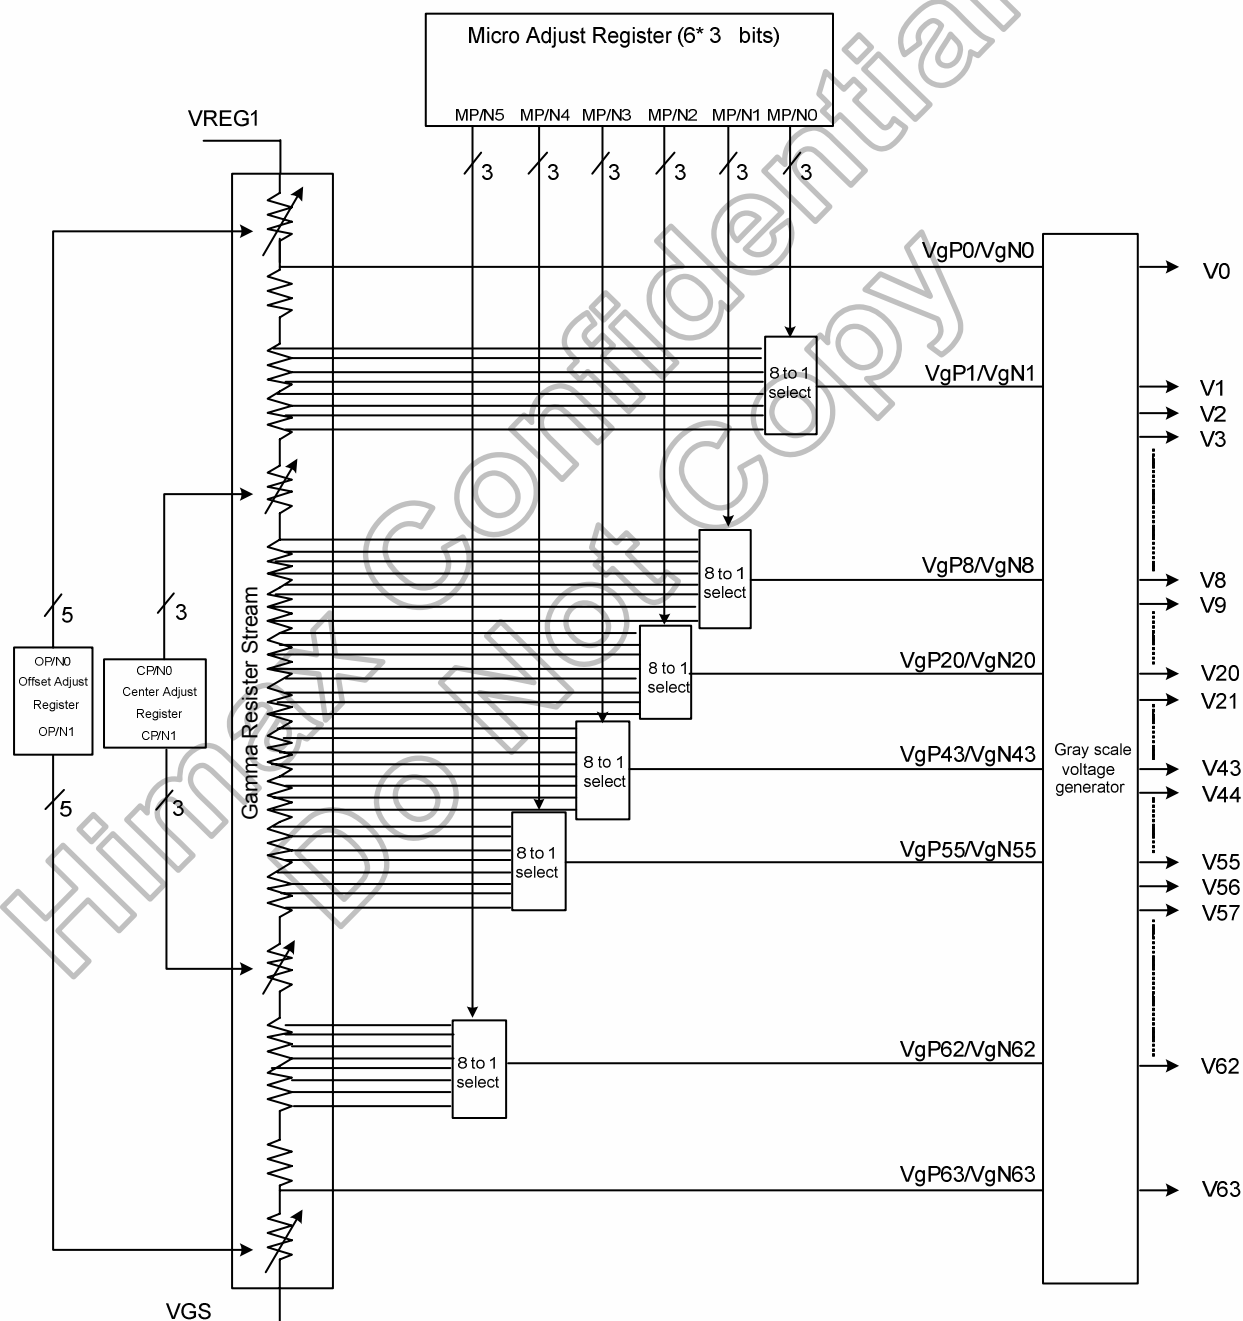

Figure 5. 38 Structure of Grayscale Voltage Generator

5.9.1.2 Gamma-characteristics adjustment register

This HX8352-A has register groups for specifying a series grayscale voltage that meets the Gamma-characteristics for the LCD panel. These registers are divided into two groups, which correspond to the gradient, amplitude, and macro adjustment of the voltage for the grayscale characteristics. The polarity of each register can be specified independently. (R, G, and B are common.)

5.9.1.2.1 Offset adjustment registers 0/1

The offset adjustment variable registers are used to adjust the amplitude of the grayscale voltage. This function is implemented by controlling these variable resistors in the top and bottom of the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities.

5.9.1.2.2 Gamma center adjustment registers

The gamma center adjustment registers are used to adjust the reference gamma voltage in the middle level of grayscale without changing the dynamic range. This function is implemented by choosing one input of 8 to 1 selector in the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities.

5.9.1.3 Gamma macro adjustment registers

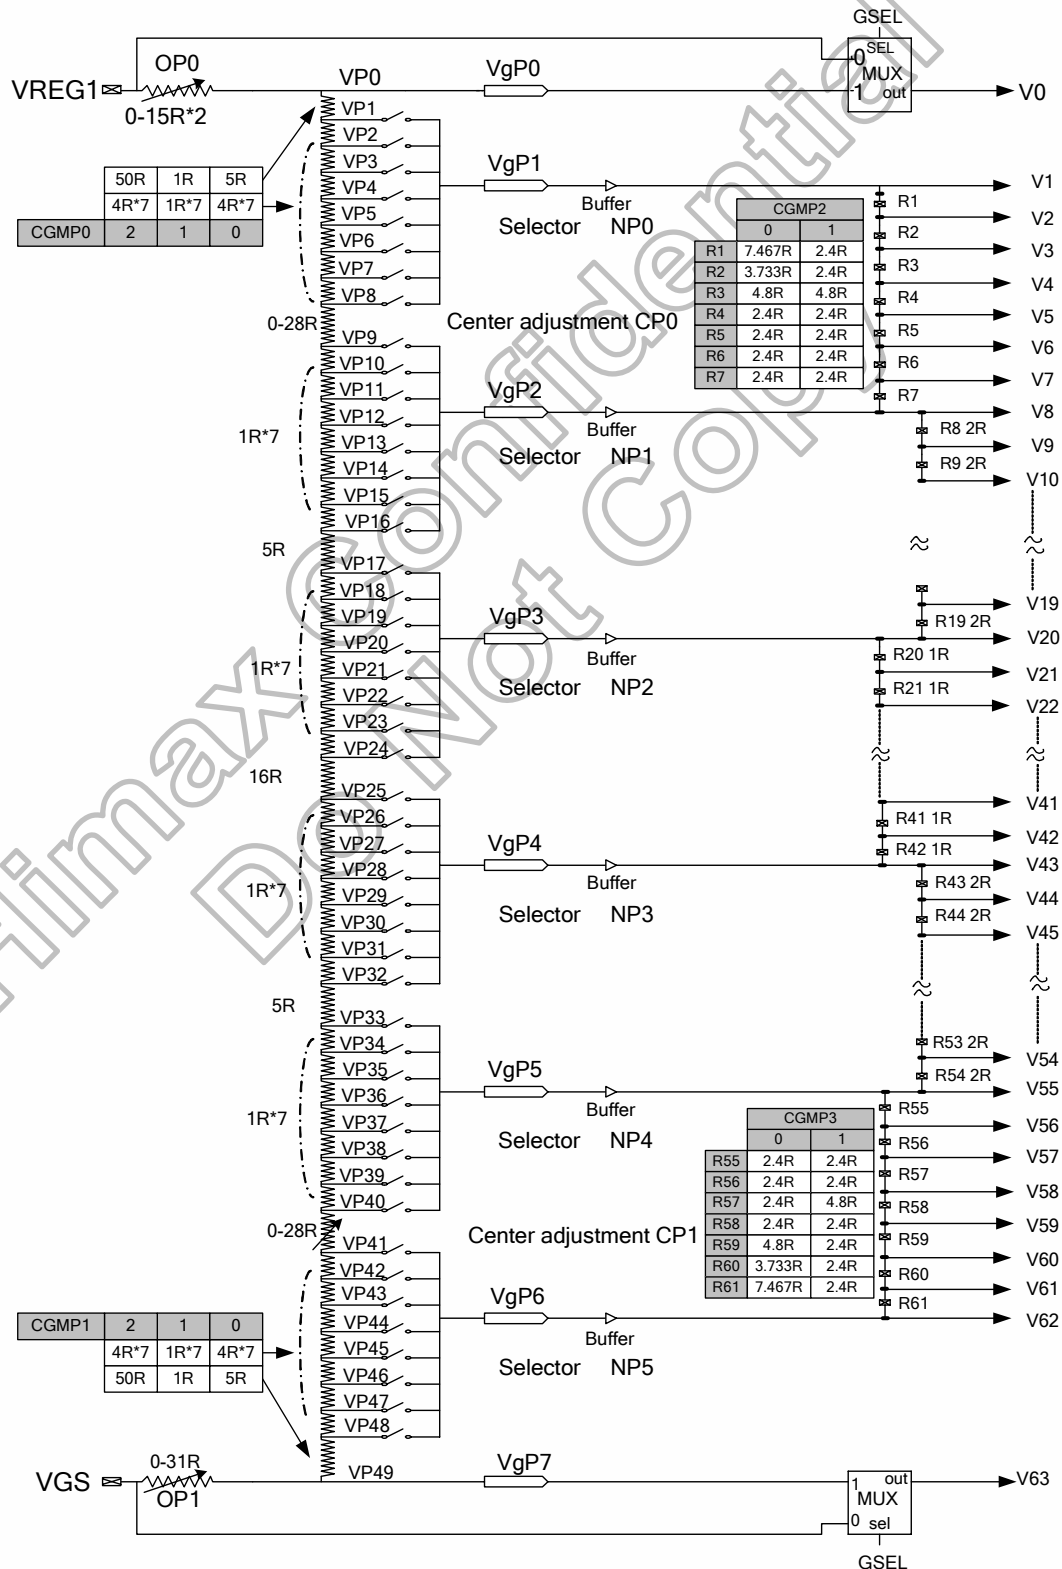

The gamma macro adjustment registers can be used for fine adjustment of the reference gamma voltage. This function is implemented by controlling the 8-to-1 selectors (MP/N0~5), each of which has 8 inputs and generates one reference voltage output (Vg(P/N)1, 8, 20, 43, 55, 62). These registers are available for both positive and negative polarities.

Register Groups	Positive Polarity	Negative Polarity	Description
Center Adjustment	CP0 2-0	CN0 2-0	Variable resistor (VRCP/N0) for center adjustment
	CP1 2-0	CN1 2-0	Variable resistor (VRCP/N1) for center adjustment
Macro Adjustment	MP0 2-0	MN0 2-0	8-to-1 selector (voltage level of grayscale 1)
	MP1 2-0	MN1 2-0	8-to-1 selector (voltage level of grayscale 8)
	MP2 2-0	MN2 2-0	8-to-1 selector (voltage level of grayscale 20)
	MP3 2-0	MN3 2-0	8-to-1 selector (voltage level of grayscale 43)
	MP4 2-0	MN4 2-0	8-to-1 selector (voltage level of grayscale 55)
	MP5 2-0	MN5 2-0	8-to-1 selector (voltage level of grayscale 62)
Offset Adjustment	OP0 3-0	ON0 3-0	Variable resistor (VROP/N0) for offset adjustment
	OP1 4-0	ON1 4-0	Variable resistor (VROP/N1) for offset adjustment

Table 5. 11 Gamma-Adjustment Registers

5.9.1.4 Gamma resister stream and 8 to 1 selector

The block consists of two gamma resister streams, one is for positive polarity and the other is for negative polarity, each one includes eight gamma reference voltages ($V_g(P/N)0, 1, 8, 20, 43, 55, 62, 63$). Furthermore, the block has a pin (VGS) to connect a variable resistor outside the chip for the variation between panels, if needed.

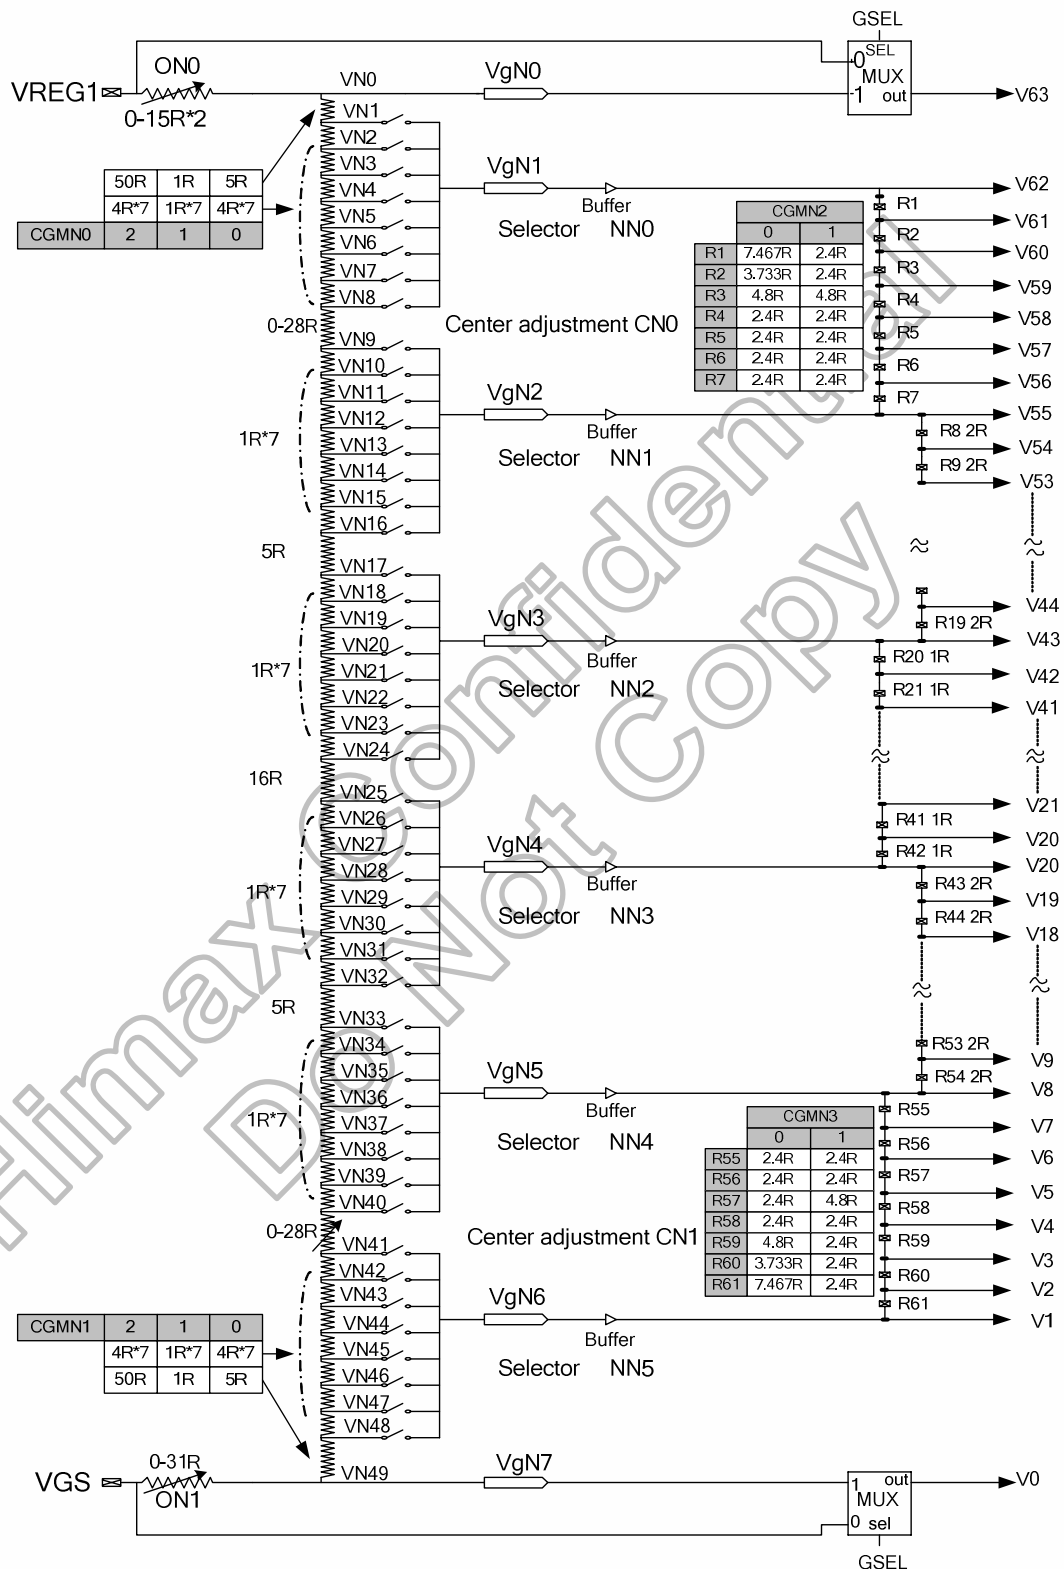

Figure 5. 39 Gamma Resister Stream and Gamma Reference Voltage

5.9.1.5 Variable resistor

There are two types of variable resistors, one is for center adjustment, the other is for offset adjustment. The resistances are decided by setting values in the center adjustment, offset adjustment registers. Their relationship is shown as below.

Value in Register O(P/N)0 3-0	Resistance VRO(P/N)0	Value in Register O(P/N)1 4-0	Resistance VRO(P/N)1	Value in Register C(P/N)0/1 2-0	Resistance VRC(P/N)0/1
0000	0R	00000	0R	000	0R
0001	2R	00001	1R	001	4R
0010	4R	00010	2R	010	8R
•	•	•	•	011	12R
•	•	•	•	100	16R
1101	26R	11101	29R	101	20R
1110	28R	11110	30R	110	24R
1111	30R	11111	31R	111	28R

Table 5. 12 Offset Adjustment 0

Table 5. 13 Offset Adjustment 1

Table 5. 14 Center Adjustment

8 to 1 Selector

The 8 to 1 selector has eight input voltages generated by gamma resistor stream, and outputs one reference voltages selected from inputs for gamma reference voltage generation by setting value in macro adjustment register. There are six 8 to 1 selectors and the relationship is shown as below.

Value in Register M(P/N) 2-0	Voltage Level					
	Vg(P/N) 1	Vg(P/N) 2	Vg(P/N) 3	Vg(P/N) 4	Vg(P/N) 5	Vg(P/N) 6
000	VP(N)1	VP(N)9	VP(N)17	VP(N)25	VP(N)33	VP(N)41
001	VP(N)2	VP(N)10	VP(N)18	VP(N)26	VP(N)34	VP(N)42
010	VP(N)3	VP(N)11	VP(N)19	VP(N)27	VP(N)35	VP(N)43
011	VP(N)4	VP(N)12	VP(N)20	VP(N)28	VP(N)36	VP(N)44
100	VP(N)5	VP(N)13	VP(N)21	VP(N)29	VP(N)37	VP(N)45
101	VP(N)6	VP(N)14	VP(N)22	VP(N)30	VP(N)38	VP(N)46
110	VP(N)7	VP(N)15	VP(N)23	VP(N)31	VP(N)39	VP(N)47
111	VP(N)8	VP(N)16	VP(N)24	VP(N)32	VP(N)40	VP(N)48

Table 5. 15 Output Voltage of 8 to 1 Selector

The grayscale levels are determined by the following formulas:

Reference Voltage	Macro Adjustment Value	Formula	Pin
VgP0	----	$[(VREG1-VD \cdot VROP0 / \text{SumRP})] \cdot GSEL + VREG1 - (VREG1 \cdot GSEL)$	VP0
VgP1	NP0 2-0=000	$VREG1-VD[(VROP0+(CGMP0 \cdot 1R)+5R- (CGMP0 \cdot 5R)) / \text{SumRP}]$	VP1
	NP0 2-0=001	$VREG1-VD[(VROP0+(CGMP0 \cdot 2R)+9R- (CGMP0 \cdot 9R)) / \text{SumRP}]$	VP2
	NP0 2-0=010	$VREG1-VD[(VROP0+(CGMP0 \cdot 3R)+13R- (CGMP0 \cdot 13R)) / \text{SumRP}]$	VP3
	NP0 2-0=011	$VREG1-VD[(VROP0+(CGMP0 \cdot 4R)+17R- (CGMP0 \cdot 17R)) / \text{SumRP}]$	VP4
	NP0 2-0=100	$VREG1-VD[(VROP0+(CGMP0 \cdot 5R)+21R- (CGMP0 \cdot 21R)) / \text{SumRP}]$	VP5
	NP0 2-0=101	$VREG1-VD[(VROP0+(CGMP0 \cdot 6R)+25R- (CGMP0 \cdot 25R)) / \text{SumRP}]$	VP6
	NP0 2-0=110	$VREG1-VD[(VROP0+(CGMP0 \cdot 7R)+29R- (CGMP0 \cdot 29R)) / \text{SumRP}]$	VP7

(Same characteristic for each RGB)

Figure 5. 41 Relationships between GRAM Data and Output Level

5.9.2 Gray voltage generator for digital gamma correction

The HX8352-A digital gamma correction can reach the independent GAMMA curve of RGB. HX8352-A utilizes LUT to change input data from 6-bit into 8-bit and sends 8-bit data to Dithering circuit, and then drive Source Driver via Dithering circuit. The following of the block diagram of the function.

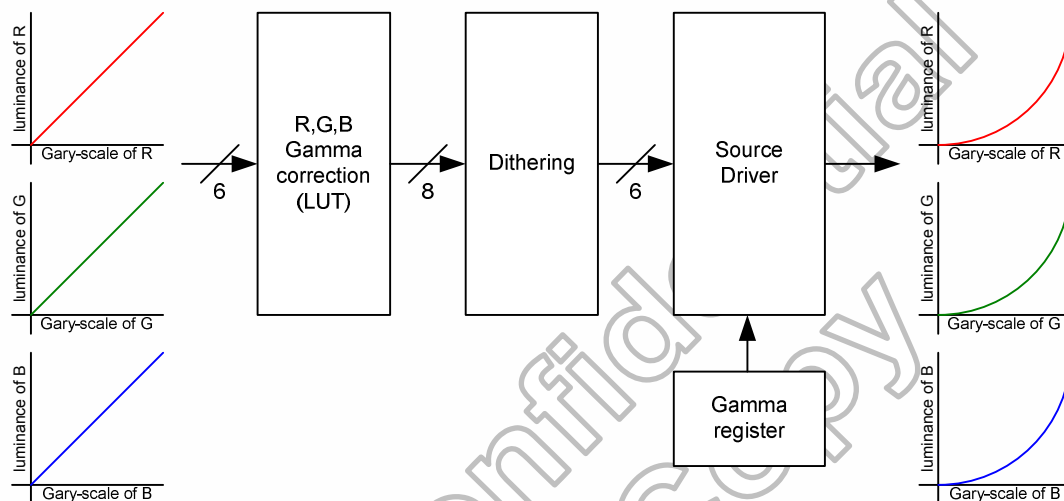

Figure 5. 42 Block Diagram of Digital Gamma Correction

The HX8352-A builds one 192-bytes LUT (Look up table) to transfer every display data of Dithering circuit input and setting by DGC LUT register (R2Fh).

Table 5. 25 LUT for Blue Color (2)

5.10 Scan mode setting

The HX8352-A can set internal register SM and GS bits to determine the pin assignment of gate. The combination of SM and GS settings allows changing the shift direction of gate outputs by connecting LCD panel with the HX8352-A.

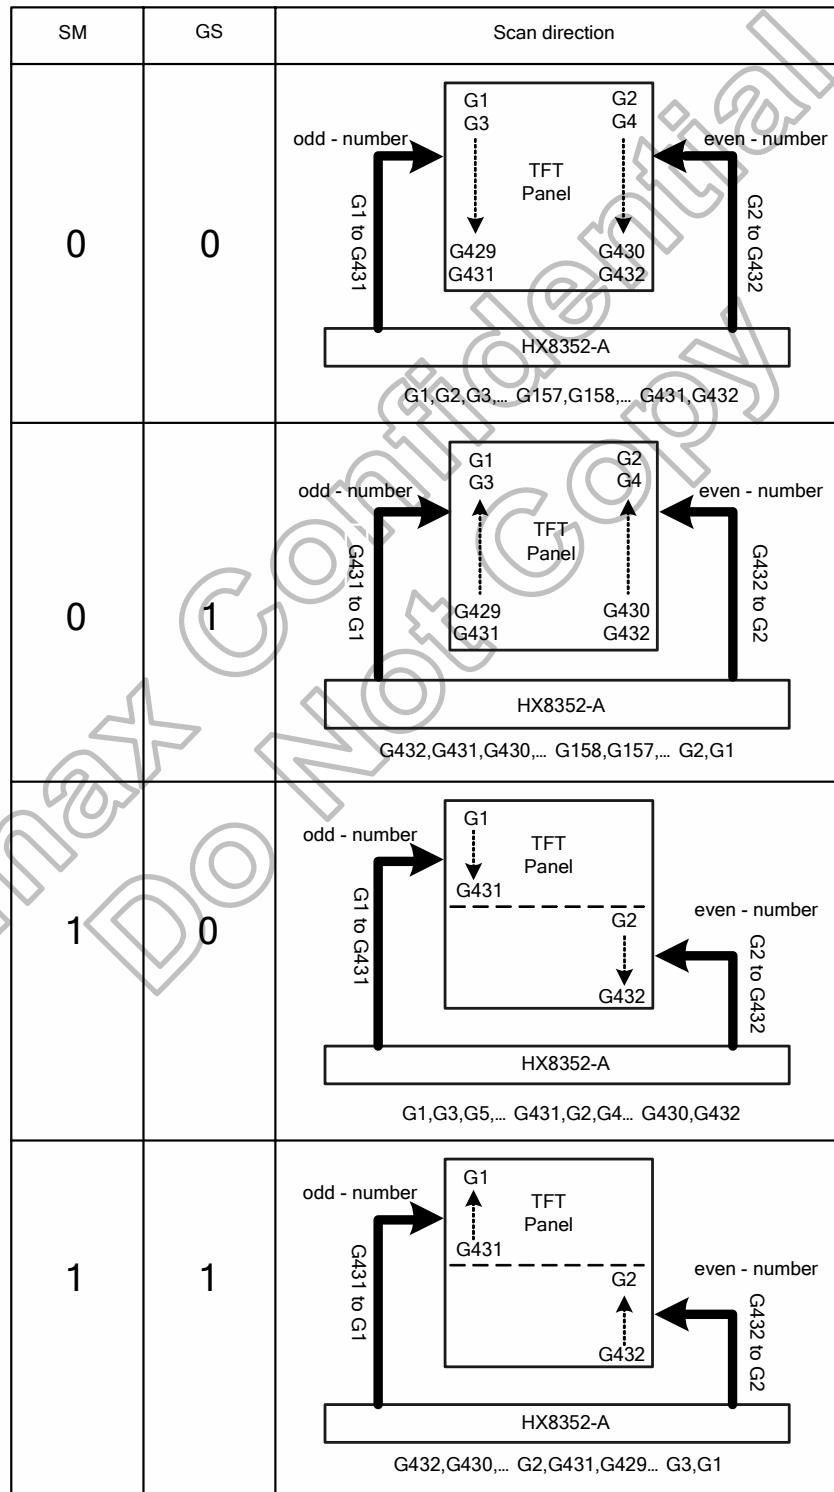

Figure 5. 43 Scan Function (240RGB x 432 Dot)

5.11 Register setting flow

The following are the sequences of register setting flow that applied to the HX8352-A driving the TFT display, when operate in Register-Content interface mode.

Display on/off set flow

	0x13h	BGR_PANEL, SM_PANEL, SS_PANEL, GS_PANEL, REV_PANEL																	
0x33h	DGC_EN																		
11	Set OTP_Mask=0x00h, programming the entire bit of one parameter.																		
12	Set OTP_PROG=1, Internal register begin write to OTP according to OTP_index.																		
13	Wait 1 ms																		
14	Complete programming one parameter to OTP. If continue to programming other parameter, set OTP_PROG=0 before return to step (9). Otherwise, power off the module and remove the external power on VGH pin.																		

5.14 Free running mode specification

Burn-in of TFT displays consists of driving each module for 10hr at a temperature of 60°C. In order to drive the modules, it requires extra electronics. To reduce the burn-in cost, it is requested that the driver IC will generate the required display image without requiring extra electronics. We term this a free running mode (FR-mode). For burn-in, it is sufficient that the display is powered up with a plane saturated black or saturated white pattern. Black should be used for burn-in, since this result in a larger pixel voltage. White is used to verify if the free running mode is properly functioning. Please note that the black and the white pattern are reversed in case of a normally black display.

Parameter	Symbol	Description
Power supply pins	IOVCC, VCI, VCC	All power supply pins
Free running mode	BURN	BURN=1, FR-mode is enabled.
Reset	NRESET	Active low pulse in order to start the FR-mode.
Chip select ⁽¹⁾	NCS	This pin will be left open during FRM mode.
Data enable ⁽¹⁾	ENABLE	This pin will be left open during FRM mode.
Reads/not write ⁽¹⁾	NRD_E, WR_RNW	This pin will be left open during FRM mode.
Data/not command ⁽¹⁾	DNC_SCL	This pin will be left open during FRM mode.
Horizontal sync ⁽¹⁾	HSYNC	This pin will be left open during FRM mode.
Vertical sync ⁽¹⁾	VSYNC	This pin will be left open during FRM mode.
Data clock	DOTCLK	This pin will be left open during FRM mode.
CPU I/F Data ⁽¹⁾	DB[0..17]	This pin will be left open during FRM mode.
SPI I/F Data ⁽¹⁾	SDI, SDO	This pin will be left open during FRM mode.

Note: (1) The BURN-pin has a pull down resistor inside the driver IC, because this pin will be left open during the normal operation in the application. The BURN-pin must be logical high for longer than 5ms before the driver IC will switch to the FR-mode in order to avoid disturbances during normal operation.

(2) As a general rule, all control pins of the interfaces like chip-select, data-enable, etc must be disabled, all mode select pins like data-not-command, interface-select etc and all data-bus pins must be set to either logic high or logic low during the FR-mode.

Table 5.27 Pin Information of Free Running Mode

Power-on sequence

The FR-mode starts automatically after the power supply is switched on and a reset pulse is applied to the Reset-pin, if the BURN pin is set to logical high. In case of separate supply pins for the analogue supply and digital supply, both supply pins will be connected together, if it is supported by the driver specification. Otherwise, each supply voltage will be switched on separately according to the requested power-on sequence. The BURN and all other digital I/F pins, which will be set to logic high during the free running mode, can be switched to logic high together with the digital supply pin. The FR-mode will be restarted if the reset pulse is applied a second time. The OTP starts to load when Reset leaves low to high.

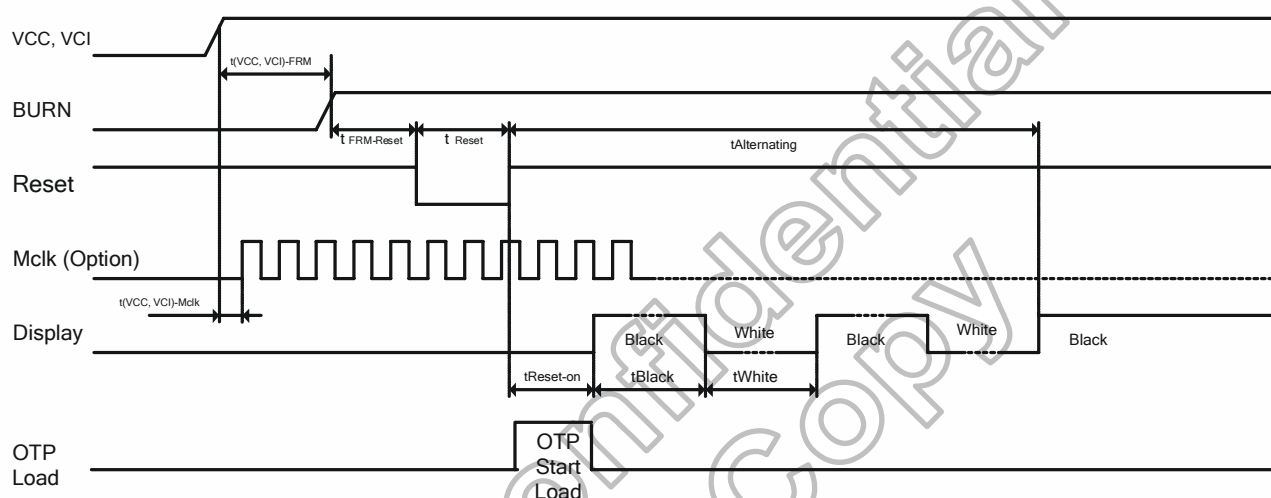

Figure 5. 48 Power On Sequence of FR-mode (for Normally-White Panel)

Power off sequence

The power supply can be switched off any time.

Figure 5. 49 Power Off Sequence of FR-mode

Free running mode display

The display will show an alternating black and white picture for about the first 5 minutes. The black to white ratio shall be 50%. The time of the black and white pattern shall be around 1 second in order to avoid a too long waiting time to verify that the FR-mode is functioning properly. The display is switched to a static black pattern after the alternating mode is finished. Thus, most efficient burn-in stress is ensured. The display shall work in idle-mode. There is no special restriction for the frame frequency. It can be between 5 and 100Hz. The frame frequency will be set according to the parameter in the OTP.

Alternating Black and White Pattern	$t_{\text{Alternating}}$	-	5	-	min
Master Clock Frequency	f_{Mclk}	-	-	10	MHz

Figure 6. 3 Display Mode Control Register (R01h)

IDMON:

This command is used for turning on/off IDLE (8-color display) mode by setting IDMON=1/0.

Note: IDLE ON do not support Digital Gamma used.

INVON:

This command is used to enter into display inversion mode by setting INVON=1. Vise versa, it recovers from display inversion mode by setting INVON=0. This command makes no change of contents of frame memory. Every bit is inverted from the frame memory to the display. This command does not change any other status.

NORON:

This command is used for turning on/off NORMAL mode by setting NORON=1/0.

PTLON:

This command is used for turning on/off PARTIAL mode by setting PTLON=1/0.

Figure 6. 11 Row Address End Register Low Byte (R09h)

These commands (R02h~R09h) are used to define area of frame memory where MCU can access. These commands make no change on the other driver status. The values of SC[15:0], EC[15:0], SP[15:0] and EP[15:0] are referred when RAMWR command comes. Each value represents one Page line in the Frame Memory.

Note: When one of R02h~R09h write into the IC, then IC will updated whole related register again.

Figure 6. 21 Vertical Scroll Button Fixed Area Register Low Byte (R13h)

These commands (R0E~0Fh, R10~11h, R12~13h) define the Vertical Scrolling Area of the display. When Memory Access Control GS=0, **TFA[15..0]** describes the Top Fixed Area (in No. of lines from Top of the Frame Memory and Display).

VSA[15..0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the bottom most line of the Top Fixed Area.

BFA[15..0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).

TFA, VSA and BFA refer to the Frame Memory Line Pointer.

When Memory Access Control GS=1,

TFA[15..0] describes the Top Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).

VSA[15..0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the top most line of the Top Fixed Area.

BFA[15..0] describes the Bottom Fixed Area (in No. of lines from Top of the Frame Memory and Display).

Figure 6. 23 Vertical Scroll Start Address Register Low Byte (R15h)

This command is used together with Vertical Scrolling Definition (33h). These two commands describe the scrolling area and the scrolling mode.

The Vertical Scrolling Start Address command has one parameter which describes

the address of the line in the Frame Memory that will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below: When Memory Access Control B4=0

Example:

When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 162 and VSP=3

When Memory Access Control B4=1

Example:

When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 162 and VSP=3

When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect.

VSP refers to the Frame Memory line Pointer.

6.15 Memory access control register (R16h)

R/W	RS	RB15	RB14	RB13	RB12	RB11	RB10	RB9	RB8	RB7	RB6	RB5	RB4	RB3	RB2	RB1	RB0

Figure 6. 24 Memory Access Control Register (R16h)

This command defines read/write scanning direction of frame memory. This command makes no change on the other driver status.

Bit	Name	Description
MY	PAGE ADDRESS ORDER	These 3 bits controls MCU to memory write/read direction. "MCU to memory write/read direction"
MX	COLUMN ADDRESS ORDER	
MV	PAGE/COLUMN SELECTION	
BGR	RGB-BGR ORDER	Color selector switch control (0=RGB color filter panel, 1=BGR color filter panel)

GS: The gate driver output shift direction selected. When GS=0, the shift direction from G1 to G480. When GS = 1, the shift direction from G480 to G1.

SS: The source driver output shift direction selected. When SS=0, the shift direction from S1 to S720. When SS = 1, the shift direction from S720 to S1.

SCROLL_ON: Vertical Scrolling Function enable, High active.

SM: Specify the scan order of gate driver. The scan order according to the mounting method of gate driver output pin

6.16 OSC control 1 register (R17h)

Figure 6. 27 Power Control 1 Register (R19h)

GASENB: This stands for abnormal power-off supervisal function when the power is off. It's for monitoring power status by NISD pad when GASENB is set to 0.

PON: Specify on/off control of step-up circuit 2 for VGL voltage generation.
For detail, see the Power Supply Setting Sequence.

PON	Operation of Step-up Circuit 2
0	OFF
1	ON

DK: Specify on/off control of step-up circuit 1 for VLCD voltage generation. For detail, see the Power Supply Setting Sequence.

DK	Operation of Step-up Circuit 1
0	ON
1	OFF

STB: When STB = "1", the HX8352-A into the standby mode, where all display operation stops, suspend all the internal operations including the internal R-C oscillator. During the standby mode, only the following process can be executed. For details, please refer to STB mode flow.

- Start the oscillation
- Exit the Standby mode (STB = "0").

In the standby mode, the GRAM data and register content are retained.

XDK, VLCD_TRI: Specify the ratio of step-up circuit for VLCD voltage generation.

VLCD_TRI	XDK	Step up circuit 1	Capacitor Connection Pins
0	0	2 x VCI	C11A, C11B
0	1	2 x VCI	C11A, C11B, CX11A, CX11B
1	0	3 x VCI	C11A, C11B, CX11A, CX11B
1	1	Setting inhibited	Setting inhibited

Figure 6. 29 Power Control 3 Register (R1Bh)

AP(2-0)

Adjust the amount of current driving for the operational amplifier in the power supply circuit. When the amount of fixed current is increased, the LCD driving capacity and the display quality are high, but the current consumption is increased. This is a tradeoff, Adjust the fixed current by considering both the display quality and the current consumption, AP(2-0) can be set as "000" when display is off and the current consumption can be reduced by stopping the operations of operational amplifier and step-up circuit.

AP1	AP0	Constant Current of Operational
0	0	Power Circuit Off
0	1	0.67
1	0	0.67
1	1	0.67

BT(3-0): Switch the output factor of step-up circuit 2 for VGH and VGL voltage generation. The LCD drive voltage level can be selected according to the characteristic of liquid crystal which panel used. Lower amplification of the step-up circuit consumes less current and then the power consumption can be reduced.

Figure 6. 34 Read Data Register (R22h)

RD17-0: Read 18-bit data from GRAM through the read data register (RDR). When the data is read by microcomputer, the first-word read immediately after the GRAM address setting is latched from the GRAM to the internal read-data latch. The data on the data bus (D17-0) becomes invalid and the second-word read is normal.

Write data register (R22h)

Figure 6. 37 Display Control 2 Register (R24h)

PT[1:0]: Non-display area source output control see follow table

INVON /REV_PANEL	GRAM Data	Source Output Level							
		Display area		Non-display Area					
				PT1-0=(0,*)		PT1-0=(1,0)		PT1-0=(1,1)	
		VCOM = "L"	VCOM = "H"	VCOM = "L"	VCOM = "H"	VCOM = "L"	VCOM = "H"	VCOM = "L"	VCOM = "H"
0	18'h00000 : 18'h3FFFF	V63 : V0	V0 : V63	V63	V0	VSSD	VSSD	Hi-z	Hi-z
1	18'h00000 : 18'h3FFFF	V0 : V63	V63 : V0	V63	V0	VSSD	VSSD	Hi-z	Hi-z

D[1:0]: When D1=1, display is on; when D1=0, display is off. When display is off, the display data is retained in the GRAM, and can be instantly displayed by setting D1 = 1. When D1= 0, the display is off with the entire source outputs are set to the VSSD level. Because of this, the HX8352-A can control the charging current for the LCD with AC driving. When D1-0 = 01, the internal display of the HX8352-A is performed although the actual display is off. When D1-0 = 00, the internal display operation halts and the display is off.

GON, DTE: Gate output select.

GON	DTE	Gate Output
0	X	VGH
1	0	VGL
1	1	VGH/VGL

Figure 6. 51 Cycle Control 3 Register (R32h)

FS0(1-0): Set the operating frequency of the step-up circuit 1 and extra step-up circuit 1 for VLCD voltage generation. When using the higher frequency, the driving ability of the step-up circuit and the display quality are high, but the current consumption is increased. The tradeoff is between the display quality and the current consumption.

DCDCf = DC / DC converter operating frequency

FS01	FS0	Operation Frequency of Step-up Circuit 1 and Extra Step-up circuit 1
0	0	DCDCf / 1
0	1	DCDCf / 2
1	0	DCDCf / 4
1	1	DCDCf / 8

FS1(1-0): Set the operating frequency of the step-up circuit 2 and 3 for VGH, VGL, VCL voltage generation. When using the higher frequency, the driving ability of the step-up circuit and the display quality are high, but the current consumption is increased. The tradeoff is between the display quality and the current consumption.

$DCDCf = DC / DC \text{ converter operating frequency}$

FS11	FS10	Operation Frequency of Step-up Circuit 2 , Step-up Circuit 3
0	0	$DCDCf / 1$
0	1	$DCDCf / 2$
1	0	$DCDCf / 4$
1	1	$DCDCf / 8$

Note: Ensure that the operation frequency of step-up circuit 1 \geq step-up circuit 2

N_NW, N_RTN: Normal mode

P_NW, P_RTN: Partial mode

I_NW, I_RTN: Idle mode

The driver IC support individual inversion type and clock per line for Normal display mode, Partial display mode and Idle (8-color) display mode. The resultant NW and RTN will be selected automatically according display mode.

NW: Frame Inversion and Line inversion control for display.

NW	Inversion Type
0	Frame inversion
1	Line inversion

RTN[3:0]: Set the 1-line period in a clock unit for normal display mode.

Clock cycles=1/internal operation clock frequency

RTN[3:0]	Clock Cycles per Line
4'b0000	249
4'b0001	250
4'b0010	251
4'b0011	252
....
4'b1110	263
4'b1111	264

DIV_N1-0: The division ratio of clocks for Normal mode internal operation (DIV1-0). Internal operations are base on the clocks which are frequency divided according to the value of DIV_N1-0. Frame frequency can be adjusted along with the 1H period (N_RTN[3:0]). When the drive line count is changed, the frame frequency must be also adjusted.

DIV_P1-0: The division ratio of clocks for Partial mode internal operation (DIV_P1-0). Internal operations are base on the clocks which are frequency divided according to the value of DIV_P1-0. Frame frequency can be adjusted along with the 1H period (P_RTIN[3:0]). When the drive line count is changed, the frame frequency must be also adjusted.

DIV_I1-0: The division ratio of clocks for Idle mode internal operation (DIV_I1-0). Internal operations are base on the clocks which are frequency divided according to the value of DIV_I1-0. Frame frequency can be adjusted along with the 1H period (I_RTIN[3:0]). When the drive line count is changed, the frame frequency must be also adjusted.

fosc = R-C oscillation frequency

DIV_N1 / DIV_P1 / DIV_I1	DIV_N0 / DIV_P0 / DIV_I0	Division Ratio	Internal Operation Clock Frequency
0	0	1	fosc / 1
0	1	2	fosc / 2
1	0	4	fosc / 4
1	1	8	fosc / 8

Formula for the Frame Frequency:

Frame frequency = fosc / (RTN × DIV × (NL+BP+FP)) [HZ]

fosc: RC oscillation frequency

The HX8352-A can control the display operation period time for LCD panel driving as follow:

SON7-0: Specify the valid source output start time in 1-line driving period. The period time is defined as SYSCLK clock number. (Please note that the setting "00h" and "01h" is inhibited).

GDOF7-0: Specify the valid gate output start time in 1-line driving period. The period time is defined as SYSCLK clock number in internal clock display mode. The period time is defined as setting value x 8 DOTCLK clock number in external clock display mode. (Please note that the setting "00h", "01h", "02h" is inhibited).

GDOF7-0: Specify the gate output end time in 1-line driving period. The period time is defined as SYSCLK clock number in internal clock display mode. The period time is defined as setting value x 8 DOTCLK clock number in external clock display mode. (Please note that the $GDOF7-0 \leq HCK-1$).

6.35 Interface control 1 register (R3Ah)

R/W	RS	RB15	RB14	RB13	RB12	RB11	RB10	RB9	RB8	RB7	RB6	RB5	RB4	RB3	RB2	RB1	RB0

Output Signal Slope

7.7.4 RGB interface characteristics

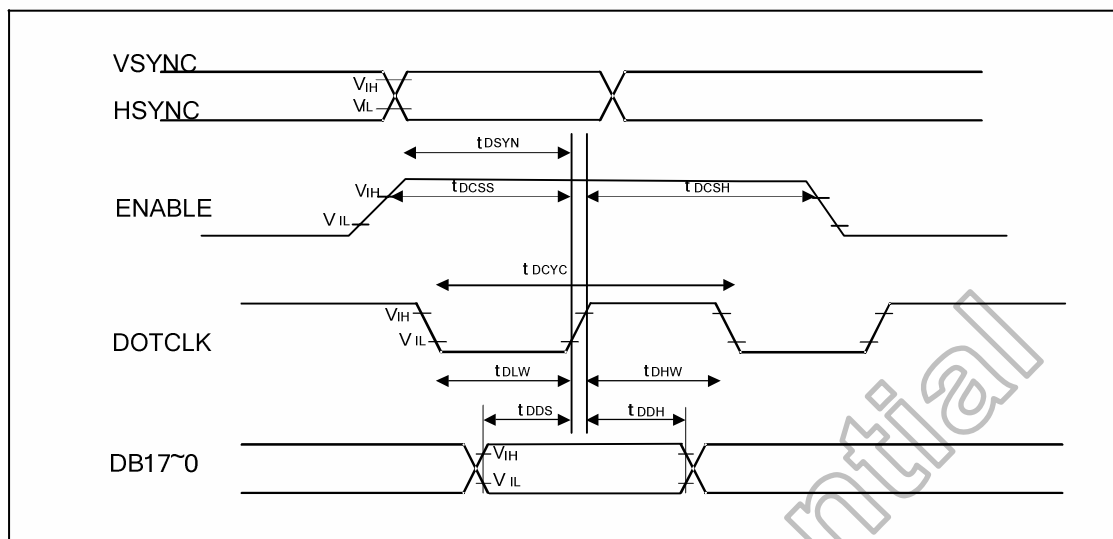

Figure 7. 6 RGB Interface Characteristics

Symbol	Parameter	Conditions	Related Pins	Spec.			Unit
				Min.	Typ.	Max.	
t_{DCYC}	DOTCLK cycle time	-	DOTCLK	100	-	-	ns
t_{DLW}	DOTCLK Low time	-		20	-	-	ns
t_{CHW}	DOTCLK High time	-		20	-	-	ns
t_{DDS}	RGB Data setup time	-	DOTCLK, DB17~0	15	-	-	ns
t_{DDH}	RGB Data hold time	-		15	-	-	ns
t_{DCSS}	ENABLE setup time	-	ENABLE	15	-	-	ns
t_{DCSH}	ENABLE hold Time	-		15	-	-	ns
t_{DSYN}	SYNC setup time	-	DOTCLK, HSYNC, VSYNC	15	-	-	ns

Note: (1) The input signal rise time and fall time (t_r , t_f) is specified at 15 ns or less.
 (2) Logic high and low levels are specified as 30% and 70% of IOVCC for Input signals.
 (3) The frequency of DOTCLK does not limited by frame rate.

Table 7. 4 RGB Interface Characteristics

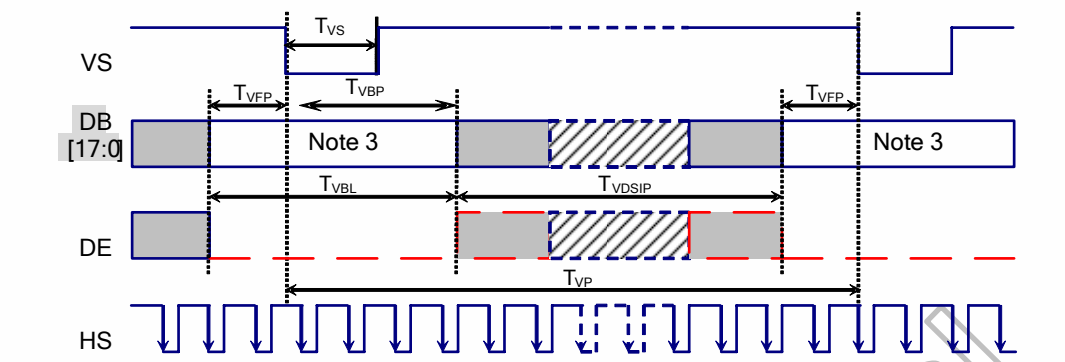

Input Signal Slope

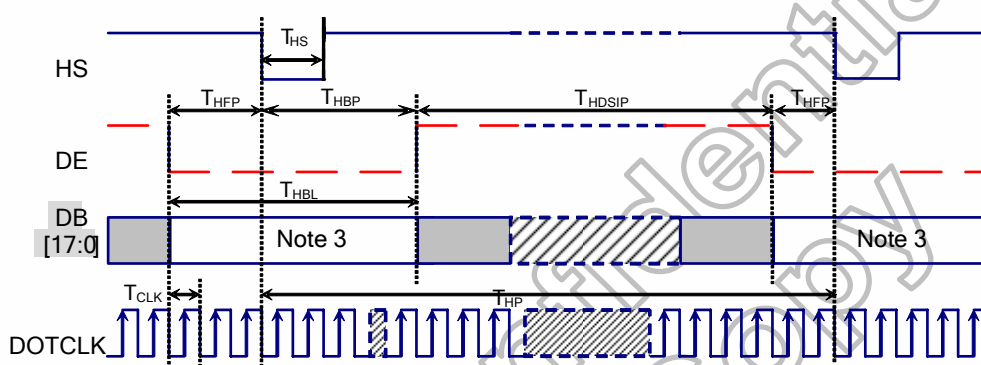

Output Signal Slope

Vertical Timing for RGB I/F

Horizontal Timing for RGB I/F

Item	Symbol	Condition	Specification			Unit
			Min	Type.	Max	
Vertical Timing						
Vertical cycle period	T _{VP}		484	488	496	HS
Vertical low pulse width	T _{VS}		2	2		HS
Vertical front porch	T _{VFP}		2	4		HS
Vertical back porch	T _{VBP}		2	4		HS
Vertical blanking period	T _{VBL}	T _{VBP} + T _{VFP}	4	8	16	HS
Vertical active area	T _{VDISP}			480		HS
						HS
						HS
Horizontal Timing						
Horizontal cycle period	T _{HP}		250	256	290	DOTCLK
Horizontal low pulse width	T _{HS}		2	4		DOTCLK
Horizontal front porch	T _{HFP}		5	8		DOTCLK
Horizontal back porch	T _{HBP}		5	8		DOTCLK
Horizontal blanking period	T _{HBL}	T _{HBP} + T _{HFP}	10	16	50	DOTCLK
Horizontal active area	T _{HDISP}			240		DOTCLK
Pixel clock cycle	f _{CLKCYC}			7.5	10.0	MHz

Note 1. IOVCC=1.65 to 3.3V, VCI=2.3 to 3.3V, VSSA=VSSD=0V, Ta=-30 to 70°C (to +85°C no damage)

Note 2. HP is multiples of DOTCLK.

Table 7. 5 Vertical and Horizontal Timing for RGB I/F

7.7.5 Reset input timing

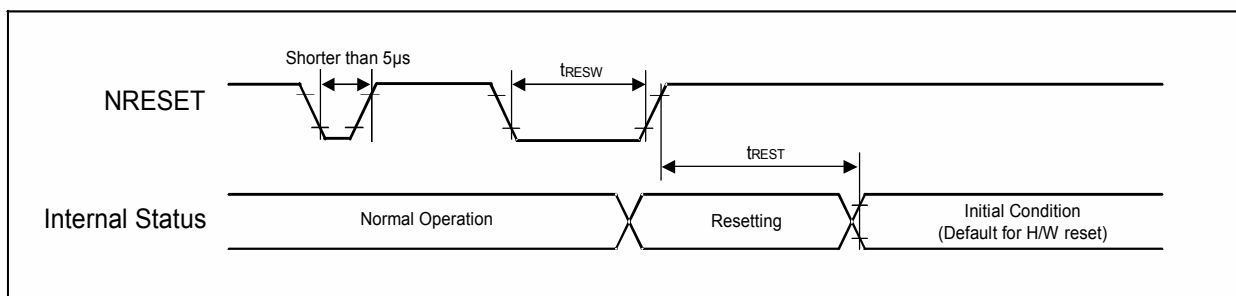

Figure 7. 7 Reset Input Timing

Symbol	Parameter	Related Pins	Spec.			Note	Unit
			Min.	Typ.	Max.		
tRESW	Reset low pulse width ⁽¹⁾	NRESET	10	-	-	-	µs
tREST	Reset complete time ⁽²⁾	-	-	-	5	When reset applied during "Sleep In mode"	ms
		-	-	-	120	When reset applied during "Sleep Out mode"	ms

Note: (1) Spike due to an electrostatic discharge on !RES line does not cause irregular system reset according to the following table.

NRESET Pulse	Action
Shorter than 5µ	Reset Rejected
Longer than 10µs	Reset
Between 5µs and 10µs	Reset Start

(2) During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Standby out –mode. The display remains the blank state in Standby In –mode) and then return to Default condition for H/W reset.

(3) During Reset Complete Time, ID2 and VCOMOF value in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (tREST) within 5ms after a rising edge of !RES.

(4) Spike Rejection also applies during a valid reset pulse as shown as below:

Symbol	Parameter	Related Pins	Min.	Typ.	Max.	Note	Unit
T1	Noise of spike	NRESET	200 ⁽¹⁾	-	100 ⁽²⁾	-	ns

Note: (1) Min is mean IOVCC as 1.65V.

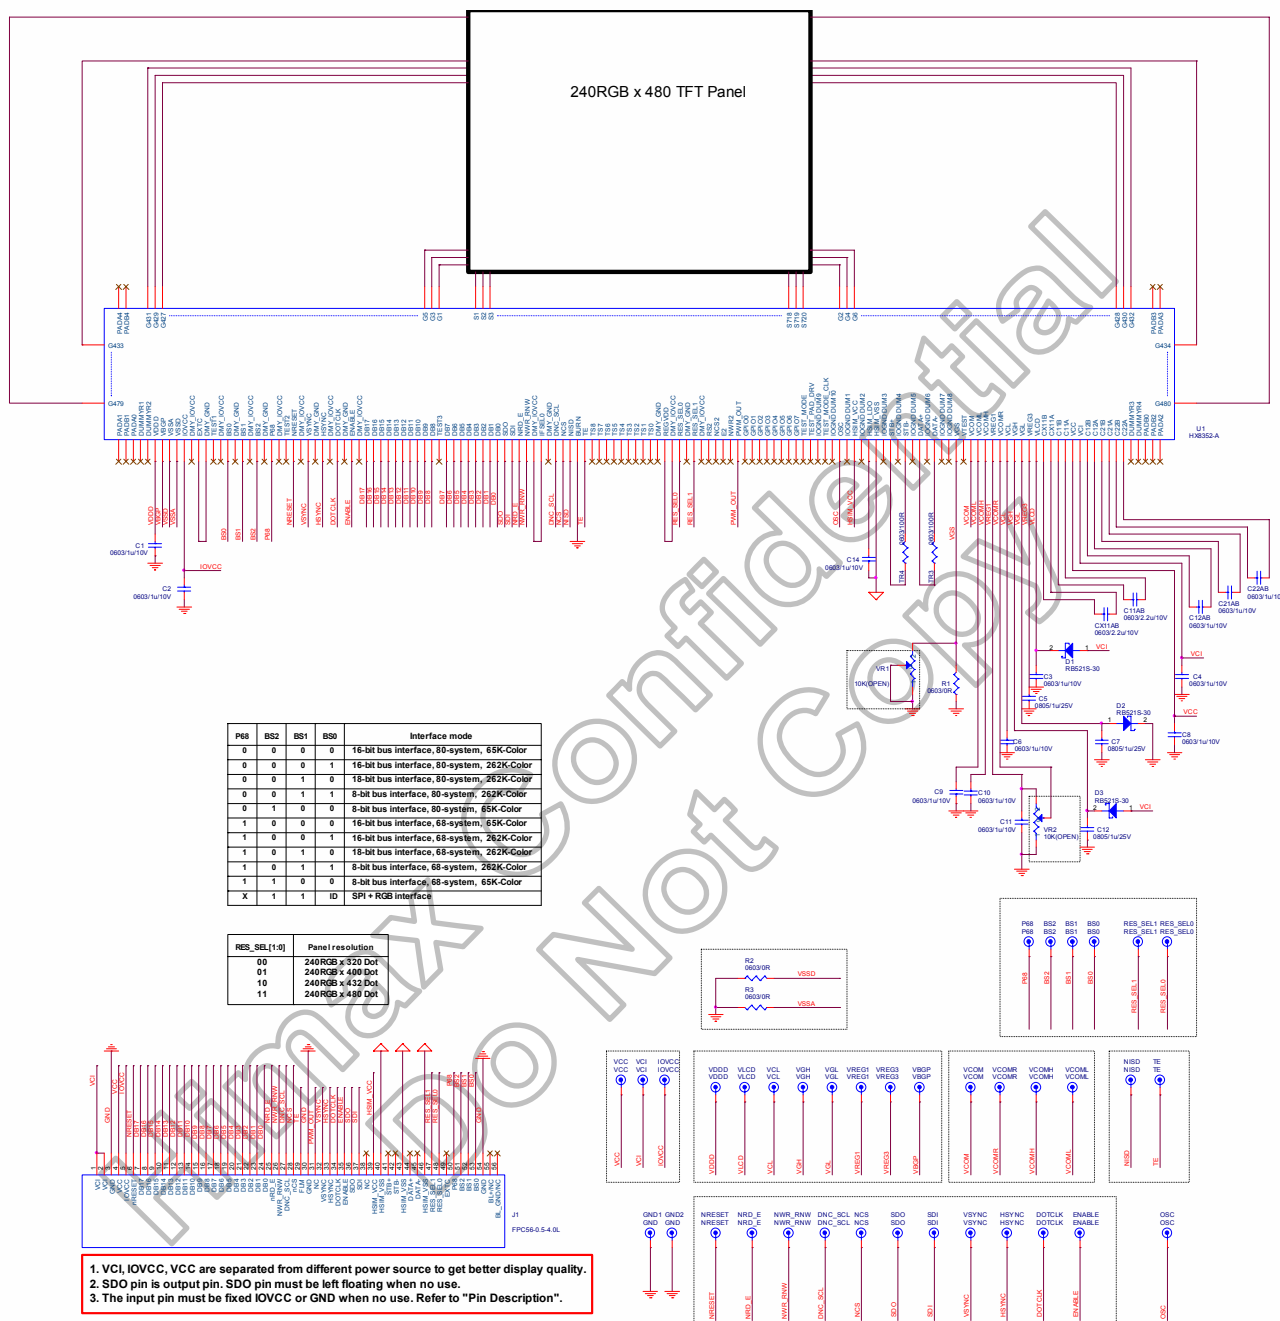

(2) Max is mean IOVCC=3.3V.

(3) It is necessary to wait 5msec after releasing !RES before sending commands. Also Sleep Out command cannot be sent for 120msec.

Table 7. 6 Reset Input Timing

8. Reference Applications

8.1 Register- content interface mode

8.2 External components connection

Pad Name	Connection	Typical Capacitance Value
VCOMH	Connect to Capacitor (Max 6V): VCOMH---(+)-- --- (-)----- VSSA	1.0μF
VCOML	Connect to Capacitor (Max 3V): VCOML ---(-)---- --- (+)----- VSSA	1.0μF
VGL	Connect to Capacitor (Max 16V): VGL ---(-)---- --- (+)----- VSSA	1.0μF
VGH	Connect to Capacitor (Max 21V): VGH ---(+)-- --- (-)----- VSSA	1.0μF
VCL	Connect to Capacitor (Max 5V): VCL ---(-)---- --- (+)----- VSSA	1.0μF
C22A,C22B	Connect to Capacitor (Max 7V): C22A ---(+)-- --- (-)-----C22B	1.0μF
C21A,C21B	Connect to Capacitor (Max 7V): C21A ---(+)-- --- (-)-----C21B	1.0μF
CX11A,CX11B	Connect to Capacitor (Max 7V): CX11A ---(+)-- --- (-)-----CX11B	2.2μF
C11A,C11B	Connect to Capacitor (Max 5V): C11A ---(+)-- --- (-)-----C11B	2.2μF
C12A,C12B	Connect to Capacitor (Max 6V): C12A ---(+)-- --- (-)-----C12B	1.0μF
VREG1	Connect to Capacitor (Max 6V): VREG1 ---(+)-- --- (-)-----VSSA	1.0μF
VREG3	Connect to Capacitor (Max 7V): VREG3 ---(+)-- --- (-)-----VSSA	1.0μF
VDDD	Connect to Capacitor (Max 6V): VDDD ---(+)-- --- (-)-----VSSA	1.0μF
VLCD	Connect to Capacitor (Max 6V): VLCD ---(+)-- --- (-)-----VSSA	1.0μF
VCI	Connect to Capacitor (Max 6V): VCI ---(+)-- --- (-)-----VSSA	2.2μF
VCC	Connect to Capacitor (Max 6V): VCC ---(+)-- --- (-)-----VSSA	2.2μF
IOVCC	Connect to Capacitor (Max 6V): IOVCC ---(+)-- --- (-)-----VSSA	1.0μF

Note: The above mentioned capacitors must be connected; otherwise it will cause poor display quality.

Table 8. 1 Connect Capacitors

Component	Specification	Remarks
Diode	VF < 0.4V / 20mA @ 25°C, VR ≥30V (Recommended diode: HSC226)	Connect to Schottky Diode
Variable Resistor (VCOMR)	> 200KΩ	Connect to variable resistor while the VcomH1 is adjusted by external voltage input.

Note: The above mentioned components must be connected; otherwise it will cause poor display quality.

Table 8. 2 Connected Schottky Diode and Resistor

9. Ordering Information

Part No.	Package
HX8352-A000 <u>PDxxx</u>	PD : mean COG xxx : mean chip thickness (μm), (default: 300 μm)

Version	Date	Description of Changes
01	2007/04/30	New setup
	2007/05/08	Update PAD coordinates.
	2007/05/10	1. Update 3. Block Diagram. 2. Update DB17~DB0 pin describe in 4.1 Pin Description 3. Modify Figure 6.93 ABC DUTY Control Register. 4. Update Table 7.2.
	2007/05/16	1. Change Figure 5.39 Index data from 00202h to 00804h. 2. Change Figure 5.40 Index data from 00202h to 00804h.
	2007/05/21	Update OTP Memory table.
	2007/05/30	1. Modify Pin number from 435 to 447 in 4.2 Pin Assignment 2. Modify Pin name in Figure 5.1 ~ 5.6.
	2007/06/01	Modify 4.1-Au Bump Size.
	2007/07/20	1. Update Gamma formula 2. Modify Figure 5.78 Gamma Resister Stream and Gamma Reference Voltage. 3. Update Table 5.18 Output Voltage of 8 to 1 Selector. 4. Update Command set
	2007/08/16	1. Add terminal resistance of 8.2 High speed Interface mode reference applications.
	2007/09/06	1. Modify Table 5. 32 EPL Bit Setting and Valid Enable Signal. 2. Modify description of EPL polarity in P150. 3. Modify description of R08h~R09h in P124. 4. Modify description of R22h (Write Data register) in P139. 5. Updated Figure 5. 89 Display On/Off Set Sequence. 6. Modify description of R53h in P67. 7. Modify description of R4F in P62. 8. Updated Reference Application circuits in P172~P173. 9. Modify description of Table 5.29 OTP Memory table. 10. Updated Figure 5.86 OTP Progrmming Flow. 11. Updated OTP Programming Sequence in P116. 12. Modify description of R25h ~ R2Ah in P143.
	2007/09/19	1. Modify description of Register Access Packet in P53.
	2007/10/29	1. Modify Pin Description of High speed part in P14~P15.
	2007/11/01	1. Modify OTP table in P114. 2. Modify register table in P120. 3. Add new register (R00h) in P122. 4. Modify RTN table in P146. 5. Add Value of AC Characteristics in P166 ~ P170.
	2007/11/21	1. Modify R56h ~ R59h index value in P158~P159. 2. Modify step 14 of PROGRAM SEQUENCE in P116. 3. Modify description of IDMON in P122.

	200712/24	1. Modify pin description in P15. 2. Add new register R95h, R96h and R97h in Register table in p121. 3. Modify N_SAP table in P151. 4. Modify description of R5Ch in P160. 5. Add new register R95h, R96h and R97h in P161-P162. 6. Modify Splike rejection of Reset input timing in P173.
02	2008/01/09	1. Remove SPI Write GRMA timing In P44. 2. Modify OTP table in P112. 3. Modify AC Characteristics in P164 ~ P168.
	2008/03/11	1. Add new register R83h in P159. 2. Add new register R85h in P159. 3. Add new register R8Bh and R8Ch in P160. 4. Modify description of R95h in P161. 5. Modify description of R97h in P162.
03	2008/03/21	1. Modify OTP table in P112.
	2008/05/09	1. Remove High speed Interface. 2. Add new register (R6Fh ~ R77h).
04	2008/08/12	1. Remove preliminary in the datasheet.
05	2008/12/24	1. Modify description of RES(1-0) setting in P12. 2. Modify R1Bh (AP table) in P98. 3. Add new register R8Ah in P123. 4. Add R6Bh and R6Ch (PWM period control setting register) in P125. 5. Add table 7.5 porch setting of RGB IF in P136.
